ABSTRACT: For centuries, the duty of loyalty has been the hallowed centerpiece of fiduciary obligation, widely considered one of the few “mandatory” rules of corporate law. That view, however, is no longer true. Beginning in 2000, Delaware dramatically departed from tradition by granting incorporated entities a statutory right to waive a crucial part of the duty of loyalty: the corporate opportunities doctrine. Other states have since followed Delaware’s lead, similarly permitting firms to execute “corporate opportunity waivers.” Surprisingly, more than fifteen years into this reform experiment, no study has attempted to systematically measure either the corporate response to these reforms, or to evaluate the implications of that response.

This Article offers the first broad empirical investigation of the area. Contrary to conventional wisdom, we find that thousands of public corporations have adopted waivers – often with capacious scope and reach. We thus establish a central empirical fact that is an important baseline for further discussion: public corporations have an enormous appetite for contracting out of the duty of loyalty when freed to do so. Our analysis also sheds light on the high-stakes normative debate around the relationship between fiduciary principles and freedom of contract. What types of corporations choose to contract around default rules? When they do so, do such measures tend to bolster or thwart shareholder welfare? We develop an efficient contracting approach to explain why corporations – and their shareholders – might favor tailoring the duty of loyalty, and we present evidence assessing the merits of Delaware’s experiment.
Contracting Out of the Fiduciary Duty of Loyalty:
An Empirical Analysis of Corporate Opportunity Waivers

**CONCLUSION** ..........................................................................................................................50
INTRODUCTION

For nearly two centuries, a cornerstone of Anglo-American corporate law has been the fiduciary duty of loyalty, the most demanding and litigated fiduciary obligation imposed on corporate managers. The duty—which regulates financial conflicts of interest and requires managers to subordinate their own interests to the corporation’s—represents a key policy lever to address the most pernicious of intra-firm agency costs. Practitioners, academics, and jurists alike have characterized loyalty as the most important fiduciary obligation, crediting it with facilitating efficient corporate stewardship and catalyzing investment and entrepreneurship. Indeed, a well-known literature in law and finance has documented the beneficial role that credible conflict-of-interest management plays in promoting company value, vibrant capital markets, and firm longevity. The duty of loyalty is also notable because of its inveterate and unyielding nature: While much of corporate law consists of “default rules” that parties may freely alter, the duty of loyalty is widely perceived as “immutable”—immune to private efforts to dilute, tailor, or eliminate it.

That perception is no longer true. Beginning in 2000, Delaware dramatically departed from tradition, amending its statutes to enable corporations to waive a critical component of loyalty—the corporate opportunity doctrine—which forbids corporate fiduciaries from appropriating new business prospects for themselves without first offering them to the company. From that moment forward, Delaware corporations and managers were free to contract out of a significant portion of the duty of loyalty. In the ensuing years, eight other states have followed Delaware’s lead, granting their own incorporated entities the statutory authority to execute corporate opportunity waivers.

1 See, e.g., Joel Seligman, The New Corporate Law, 59 BROOK. L. REV. 1, 3 (1993) (describing the duty of loyalty as the “most important fiduciary duty of corporate officers and directors”); 1 REG. OF INVEST. MGMT. & FIDUCIARY SERV. § 11:18 (noting loyalty as “the most important duty which arises within the context of fiduciary relationships”); see also note 29. The centrality of the duty of loyalty in Anglo-American corporate law goes back at least to the mid-19th century English case of Aberdeen Ry. Co. v. Blaikie, 1 MACQ 461 (1854). See generally David Kershaw, The Path of Corporate Fiduciary Law, 8 NYU J. L. & BUS. 395, 428-33 (2012) (discussing Aberdeen Ry. and its progeny). The duty of loyalty has also been the object of some of legal rhetoric’s most celebrated passages. See, e.g., Meinhard v. Salmon, 249 N.Y. 458, 464 (1928) (describing loyalty as demanding a “duty of the finest loyalty,” far “stricter than [not honesty alone, but the punctilio of an honor the most sensitive”).

(COWs). The Corporate Laws Committee of the ABA has also recently proposed amending the Model Business Corporation Act to permit advance waivers of corporate opportunities.

The reform movement sparked by Delaware represents a significant departure from long-settled understanding and common law tradition—one that concerns a basic tenet of company law. It is thus surprising that no significant study to date has empirically assessed firms’ response to these reforms (save for anecdotal accounts suggesting that there has been little response). This Article endeavors to fill this void, presenting a broad empirical assessment of how public companies responded to the statutory reforms and developing a broader conceptual and theoretical account to predict and explain that response. To our knowledge, we are the first to offer either type of assessment.

Based on an extensive data set of U.S. public companies’ filings with the Securities and Exchange Commission (“SEC”), we isolated over 10,000 unique disclosures that were plausible corporate opportunity waivers. We then refined these data in two ways. First, we manually coded a large subset along a variety of dimensions pertaining to the existence, scope, reach, and location of a waiver. Second, we used our hand-coded sample to train a machine-learning algorithm, thereby extending our coding protocol to the entire population of candidate documents. In contrast to the conventional wisdom, we find that hundreds of public corporations in our sample – and thousands in the population – have executed waivers, with terms that apply broadly across both managerial ranks and categorical domains. We thus establish a central empirical fact that is an important baseline for further discussion: Public companies have an enormous appetite for tailoring the duty of loyalty when freed to do so.

Alongside these empirical findings, our analysis takes on several fundamental questions raised by widespread adoption of waivers of corporate opportunities: Why would a corporation ever choose to restrict the reach of the duty of loyalty? What form will the optimal allocation of corporate opportunities plausibly take in different companies? Under what conditions would such waivers be valuable to shareholders,

10 We note that the vast majority—but not all—of our data sets’ disclosures come from publicly traded companies. See infra Part III.
11 See infra Part II.
notwithstanding that such waivers constrain the fiduciary duties owed to shareholders? Delaware’s sixteen-year statutory experiment also provides a unique opportunity to revisit some foundational issues in corporate law with a fresh perspective. Indeed, there is a vigorous, decades-old debate that asks whether any of corporate law’s rules should be mandatory, or whether parties instead should be free to contract out of every governance requirement as they already can from most. That debate concerns whether enlarging the contracting space for fiduciary duties results in greater efficiencies from tailoring, or instead in unchecked opportunism. There is also a significant set of issues involving whether corporations actually make use of the freedom frequently given them by corporate law to replace default rules, and whether, when they do so, it serves shareholders’ interests.

We argue that there are, in fact, several plausible economic rationales for a corporation to embrace a COW for the sake of shareholder value. Indeed, in the years leading up to Delaware’s initial reform, a growing chorus of critics argued that the exacting requirements of the duty of loyalty had begun to impede corporations’ ability to raise capital, build efficient investor bases, and secure optimal management arrangements. This claim was based in part on the recognition that many then-emerging sources of capital, such as private equity, venture capital, or spin-off transactions may subject their financial sponsors to fiduciary duties in profound conflict with either their larger business plans or with fiduciary obligations they owe to other business entities. Absent the contractual ability to clarify ownership rights regarding new business opportunities, it is difficult to see how such capital structures could stably persist within the standard corporate arrangement.

Consider, for example, one of the issuers in our database: Prosper Marketplace, Inc., the first and still one of the largest peer-to-peer lenders. The waiver that Prosper adopted in its charter covered any member of Prosper’s board who was not also an employee. The four outside directors in place at the time of the company’s public filing (and a majority of the board) worked for financial firms – three of them in venture capital – and at that point served as directors for at least fourteen other companies, including another online commercial market. As a risky entrepreneurial start-up, Prosper was an ideal candidate for the venture capital financing model. Yet it is difficult to see how those outside directors could avoid intractable fiduciary conflicts without first securing waivers defining the boundaries of their loyalty obligations across different companies.

That said, simply because there are plausible conditions where COWs could enhance shareholder welfare, it does not follow that the firms actually adopting waivers satisfy those conditions. Our empirical analysis allows us to get some traction on this

13 See infra notes 110-104 and accompanying text.
14 See infra Subsection I.B.2.
16 That Charter was attached to Prosper’s 2007 S-1 filing (available on the Edgar interface at https://www.sec.gov/Archives/edgar/data/1416265/000110465907078072/0001104659-07-078072.txt)
17 For those who followed the well-known litigation in In re Trados Inc., 73 A.3d 17, 40-41 (Del Ch. 2013), Prosper suggests a number of possibly instructive analogies.
question as well. We find that COW adopters are, on average, reasonably established firms with moderate-to-high asset values. They typically generate sizeable revenues, and they tend to deliver larger overall market returns to their capital investors by comparison to other public companies. Delaware corporations are over-represented, as are firms in industries where diversified, active investments across multiple portfolio companies are the norm (such as venture capital and oil and gas). As a descriptive matter, then, it does not appear that companies that execute waivers are systematically the unscrupulous bottom feeders of the corporate ecosystem. To the contrary, they appear—by and large—to be healthy, growing, and profitable business organizations.

In addition to these descriptive statistics, we further assess whether the adoption of a waiver tends to add or dilute value on the margin, by analyzing market reactions to issuers’ first public disclosure of a COW. Our event study analysis reveals that market reactions appear favorable, resulting in an average positive abnormal stock return hovering around one percent in the days immediately surrounding the announcement date. This positive reception is more pronounced for Delaware corporations, and for those with asset values just below $1 billion. Market response does not seem sensitive, in contrast, to whether the waiver also covers officers and/or dominant shareholders, nor does it appear to vary depending on whether the COW was adopted in a proposed charter amendment, a board-promulgated resolution, or something else. In addition, we demonstrate that firms incorporated in the nine states embracing Delaware-style reform have experienced positive abnormal stock-price returns on and around the date that such reforms became inevitable. All told, we view these findings as suggestive that public companies not only have embraced their new-found liberty to tailor the fiduciary duty of loyalty, but that they have done so in ways that shareholders welcome (or at least do not disfavor). Our findings are also pertinent for considering current debates about shareholder activism, the appropriate role of “constituency” directors, and whether the delineation of such roles should be subject to immutable rules or left up to the issuers themselves.  

Several caveats to our analysis warrant attention before proceeding. First, we note that our study is limited to waiver disclosures contained in SEC filings. This data source imposes some unavoidable constraints. Most obviously, because privately held firms are far less likely to be SEC reporting entities, the disclosures we observe skew towards publicly traded companies. In addition, the statutory provisions permitting COWs tend to grant wide latitude to companies about how and where they promulgate a waiver, and thus even for public companies a waiver could be buried in any number of public filings. While it is important to remain mindful of these limitations, we note that a significant fraction of our data set does include private companies, including newly spun-off entities and private companies with public debt. Moreover, the protocol we designed for identifying candidate waivers casts a deliberately wide net, combing through the entire universe of SEC filing with search criteria designed deliberately to capture a large

---

18 See, e.g., J. Travis Laster and John Mark Zeberkiewicz, The Rights and Duties of Blockholder Directors, 70 BUS. LAWYER 33, 49-50 (2015) (arguing that constituency directors should all be compelled to pursue long-term value for shareholders).
fraction of “false positive” candidates — a population we could later winnow using sampling, manual coding and machine learning techniques.\textsuperscript{19}

Second, in practice, the disclosure of a COW is frequently “bundled” with other disclosures (such as an announced spin-off, carve-out, significant investment, reorganization, etc.). It is no doubt possible—and perhaps likely—that the market’s reception of a COW is really an amalgamated reaction to the totality of contemporaneous disclosures. Failing to account for such confounds, one might argue, can lead to spurious conclusions about the market response to waivers in particular. Although we take this concern seriously, the appropriate response is far from clear. Indeed, proponents of Delaware’s reform maintained that an enforceable COW is a critical precondition for the very transactions that now typically accompany it. To the extent that this claim is valid, it would be inappropriate not to analyze the COW alongside the other bundled disclosures it facilitates. Nevertheless, as a robustness check, we also exploit the time-lagged implementation of reforms at the state level, starting with Delaware and spreading to eight other states over time. We similarly find evidence of a positive market response to passage of a COW reform among issuers incorporated inside the reforming jurisdiction.

Third, it is important to acknowledge that even if COWs help augur shareholder welfare, it need not follow that other corporate constituencies benefit as well (if at all). In particular, a recent literature in antitrust economics has begun to document systematically the rise of “horizontal” ownership structures where a common investor holds appreciable equity across several ostensibly competing firms (often with board representation).\textsuperscript{20} Such practices raise legitimate concerns that the common shareholder will help orchestrate anticompetitive coordination by the firms against their customers, employees, or trading partners. The ready availability of a COW may further exacerbate this problem, by permitting the common shareholder to choreograph collusion behind the scenes, with little fear of litigation risk from minority shareholders hoping for a larger payday. Such concerns seem entirely plausible in our data: we demonstrate below that nearly two in five waivers extend protection to certain of the issuer’s shareholders.\textsuperscript{21}

Finally, most statutes enabling companies to execute COWs (including Delaware’s) also subject that decision to a “back door” duty-of-loyalty analysis.\textsuperscript{22} For example, if an interested director, officer, or dominant shareholder were to use her domination of the board to force through a self-serving COW, then the promulgation of the waiver could itself be invalidated as self-dealing. The issuers embracing waivers within our data set have done so against the backdrop of this liability exposure—one animated, ironically enough, by a lingering vestige of \textit{immutability} within the duty of loyalty, which pertains to acts purporting to limit the duty.

\textsuperscript{19} See infra Part III.
\textsuperscript{21} See Part III, infra.
\textsuperscript{22} For a general discussion of this limitation (which appears in the statutory synopsis but not the statute itself), \textit{see infra} Part I.B.2.
Our analysis proceeds as follows. Part I revisits the broad contours of fiduciary duties, providing a brief overview of the duty of loyalty and the corporate opportunities doctrine. We also trace the evolution of COWs, from pre-reform waiver efforts, to their skeptical reception by Delaware’s courts, to the enactment of the Delaware reforms and related statutes, and finally to subsequent litigation addressing waivers. In Part II, we lay out a conceptual framework and model of efficient contracting over corporate opportunities, in order to capture the contexts in which a COW would be value enhancing, and what form it would plausibly take. Part III describes the empirical methodology behind our data set, offering a series of descriptive statistics about both the structure of COWs and the types of companies embracing them. We also report on a series of event studies documenting positive market reactions to companies’ first disclosure of a COW. Part IV discusses the broader legal and policy implications of our analysis.

I. REVISITING THE DUTY OF LOYALTY

Before exploring our theoretical and empirical enterprise, it will be useful to first provide an overview in Section A of the broad contours of the duty of loyalty and corporate opportunities doctrine (“COD”). In Section B, we turn to the process by which Delaware and other states implemented statutory reforms empowering corporations to execute COWs.

A. Fiduciary Law and the Corporate Opportunities Doctrine

1. Fiduciary Duties and the Duty of Loyalty

Corporate fiduciaries – the officers who manage a company’s daily operations, the directors who wield ultimate decision-making authority, and the dominant shareholders who possess swing voting power – exercise control over a vast amount of social resources on behalf of corporations’ ultimate owners, their shareholders. Among the law’s principal tools for ensuring that corporate fiduciaries serve the interests of all of a corporation’s owners faithfully and competently are the fiduciary duties of loyalty and care.

The duty of care mandates that corporate fiduciaries exercise informed business judgment in their stewardship of the company, imposing liability if a fiduciary acts (or fails to act) without first being adequately informed. While this duty could conceivably reach almost any major decision by corporate decision-makers, its scope is cabined by a wide-variety of judicial and private limitations. Alongside the famous defendant-friendly “business judgment rule,” corporations are permitted to insure their directors and officers against breaches of the duty of care, and to indemnify their directors for expenses incurred in connection with defending against allegations of breaches. Lastly, Delaware and the vast majority of other states allow parties to contract around the duty of care in

---

24 The business judgment rule is a “presumption that in making a business decision, the directors of a corporation acted on an informed basis, in good faith and in the honest belief that the action taken was in the best interests of the company.” Aronson v. Lewis, 473 A.2d 805, 812 (Del. 1984).
25 See, e.g., Del. Code Ann. tit. 8, § 145(a)-(g).
various respects. For instance, since the 1980s, almost all states have permitted a corporation to adopt a charter provision limiting or eliminating the personal liability of corporate directors for breaching the duty of care.26 Public companies regularly execute such exoneration provisions.27

The duty of loyalty prohibits fiduciaries from benefiting improperly from financial conflicts of interest. In stark contrast to the duty of care, loyalty has traditionally been immutable. The Delaware statute that enables corporate charters to limit or eliminate directors’ monetary liability for breaches of fiduciary duty, for example, expressly excludes the duty of loyalty from its reach.28 Moreover, unlike with the duty of care, the deferential business judgment rule is also inapplicable to alleged breaches of loyalty. Loyalty’s traditionally mandatory character is part of why commentators have widely held the duty to be “the most important duty which arises within the context of fiduciary relationships”29 as well as the subject of most fiduciary litigation.30

The duty of loyalty requires fiduciaries to “exercise their authority in a good-faith attempt to advance corporate purposes.”31 While there is an affirmative dimension to this duty, its normal role is to bar self-interested action by officers or directors, which involves a conflict of interest with the corporation itself. Perhaps the most colorful summary of the duty of loyalty is still the seminal opinion of Meinhard v. Salmon32—a case involving a contested business opportunity of an unincorporated partnership that has been widely adopted and cited in corporate law jurisprudence. Defendant Salmon and

28 Del. Code Ann. tit. 8, § 102(b)(7) (specifically precluding a corporate charter from eliminating or limiting director liability “[f]or any breach of the director’s duty of loyalty to the corporation or its stockholders”). A small number of states’ corporate law may differ from Delaware in this respect. Nevada, for example, seems devoted to developing a niche as a near “liability-free” jurisdiction for managers. Michal Barzuza, Market Segmentation: The Rise of Nevada as a Liability-Free Jurisdiction, 98 V. A. L. Rev. 935 (2012). Under Nevada law, the default rule is that there is no liability for a breach of the duty of loyalty, absent “intentional misconduct, fraud or a knowing violation of law.” Nev. Rev. Stat. Ann. §78.138(7) (“unless the articles of incorporation . . . provide for greater individual liability, a director or officer is not individually liable to the corporation or its stockholders or creditors for any damages as a result of any act or failure to act in his or her capacity as a director or officer unless it is proven that: (a) The director’s or officer’s act or failure to act constituted a breach of his or her fiduciary duties as a director or officer; and (b) The breach of those duties involved intentional misconduct, fraud or a knowing violation of law.”).
30 See Allen & Kraakman, supra note 26, at 229.
31 Id.; Smith v. Van Gorkom, 488 A.2d 858, 872 (Del. 1985).
32 249 N.Y. 458, 464 (1928).
plaintiff Meinhard entered a joint venture to lease and improve a Manhattan hotel, which ultimately proved quite successful. As a result of the venture, Salmon (the active manager) came to owe fiduciary duties to Meinhard (a largely silent partner). Near the end of the lease, the hotel’s new owner offered Salmon a successor lease to manage and improve a vastly larger set of related properties. After the new lease had been signed, Meinhard, who was previously uninformed about the lease offer, discovered it and demanded a pro-rata share. A referee found that Meinhard was owed such an interest in the expanded venture in a fraction roughly proportionate to his interest in the first one.

In a majority opinion authored by Chief Justice Benjamin Cardozo, the high court of New York affirmed. The opinion was quickly recognized as one for the ages. Cardozo famously declared that fiduciary ties demand a duty of “finest” and “undivided” loyalty, far “stricter than the morals of the market place,” concluding instead:

Not honesty alone, but *the punctilio of an honor the most sensitive*, is then the standard of behavior . . . the level of conduct for fiduciaries [has] been kept at a level *higher than that trodden by the crowd.*

Salmon held the lease “as a fiduciary,” and improperly “appropriated it to himself in secrecy and silence.” The broad language of Meinhard and similar cases becomes concrete in the various forms of managerial conduct regulated by the duty of loyalty, including transactions between a corporation and its directors; self-dealing; control transactions; and executive compensation. That said, our focus here will be trained on the allocation of new business opportunities between the firm and the fiduciary.

2. The Corporate Opportunities Doctrine

The corporate opportunities doctrine (“COD”) is a key foundational component of the duty of loyalty. The basic idea of the COD is that corporate fiduciaries may not appropriate for themselves a new business opportunity that belongs to the corporation, unless they first present it to the corporation and receive authorization to pursue it personally. As a result of the considerable amount of litigation arising from the COD and its complexity, it may be the only part of the duty of loyalty that has developed its own labyrinth of rules, subcategories, standards, and tests.

The Delaware cases of *Guth v. Loft* and *Broz v. Cellular Information Systems, Inc.* provide defining benchmarks for the modern COD (both inside and outside Delaware). The doctrine states that an officer or director of a corporation usurps a business opportunity if (1) the corporation is able to financially undertake that opportunity; (2) the opportunity is in the corporation’s line of business; (3) the

---

34 *Id.* at 464; *Id.* at 468 (“the rule of undivided loyalty is relentless and supreme.”).
37 673 A.2d 148 (Del. 1996).
corporation has an “interest or a reasonable expectancy” in it; and (4) by pursuing the opportunity personally, the fiduciary “will be placed in a position iminimal to his duties to the corporation.”38 Courts engage in a fact-intensive inquiry to see whether a given fiduciary’s pursuit of a business opportunity was impermissible under this multi-factor test.

There is a simpler way to think of the doctrine, however, as a sequential inquiry. The first major question is whether a given business prospect constitutes a bona fide “corporate opportunity,” thereby posing a genuine conflict of interest.39 A number of fairly involved tests are employed by courts in determining whether a given business prospect is a corporate opportunity.40 If the prospect is not a corporate opportunity, then a fiduciary does no wrong by simply pursuing it herself without informing the corporation. If the prospect is a corporate opportunity though, then the appropriate course of action is to offer it to the corporation. If the corporation properly rejects that opportunity – paradigmatically, by a majority vote of disinterested directors – then the fiduciary again does no harm by pursuing it, while if the corporation does not reject it, the fiduciary is barred from pursuit of the prospect.

There are also a number of affirmative defenses that importantly shape the contours of the COD. Thus, some courts have found fiduciaries not to have usurped corporate opportunities because they encountered the opportunity in their personal capacity;41 the corporation impliedly rejected the opportunity;42 and most importantly, because the corporation was not able to pursue a given business prospect, perhaps because the corporation’s financial condition precluded it from doing so.43 If even this stylized description of the COD sounds involved, that is largely a reflection of the doctrine itself. The law’s attempt to regulate fiduciaries’ independent pursuit of business opportunities has produced a doctrine of startling complexity and unpredictability.44

38 Guth v. Loft, Inc., 23 Del. Ch. 255, 273 (1939); Broz v. Cellular Inf. Sys., 673 A.2d 148, 151 (Del. 1996). The same test continues to be employed consistently. See, e.g., In Re. Riverstone Nat’l Inc., SH Lit., C.A. No. 9796-VCG at 21 (July 28, 2016) (applying test to hold that the plaintiff adequately pled facts alleging that the directors of a cash-out merger target were not disinterested, since directors’ personal exposure to viable corporate opportunity claims would be “obliterated” under terms of the acquisition).
40 The three major tests are the “line-of-business” test, see, e.g., Guth v. Loft, Inc., 23 Del. Ch. 255, 273 (1939), the “interest-or-expectancy” test, see, e.g., Lagarde v. Anniston Lime & Stone Co., 126 Ala. 496, 28 So. 199 (1900), and the “fairness” test, see, e.g., Durfee v. Durfee & Canning, 323 Mass. 187, 80 N.E.2d 522 (1948).
41 See, e.g., Central Ry. Signal Co. v. Longden, 194 F.2d 310, 319 (7th Cir. 1952).
44 See Talley, supra note 39, at 279 n.2 (1998), citing Northeast Harbor Golf Club, Inc. v. Harris, 661 A.2d 1146, 1148-49 (Me. 1995) (“[T]here has been much confusion about the specific extent of [the fiduciary] duty when . . . it is contended that a fiduciary takes for herself a corporate opportunity.”); Miller v. Miller, 222 N.W.2d 71, 79 (Minn. 1974) (“We have searched the case law and commentary in vain for an all-inclusive or ‘critical’ test or standard by which a wrongful appropriation can be determined and are persuaded that the doctrine is not capable of precise definition.”); ROBERT CHARLES CLARK, CORPORATE LAW 244-45 (1986) (“The traditional tests are extremely ambiguous and uncertain in their application.”).
The COD is not only among the most litigated and murkiest aspects of the duty of loyalty, but the form of misconduct it targets – the usurpation of business opportunities – is one of the most pernicious types of agency cost. When the issue is one of who “owns” rights to a business opportunity, then the interests of a corporation and its agent are not merely misaligned, but may be completely at odds with each other. This is compounded by the fact that the COD addresses behavior that not only can reduce the value of a firm, but in which a fiduciary may usurp from its principal a new venture whose value significantly exceeds that of the corporation. For instance, as Meinhard v. Salmon illustrates, the value of usurped corporate opportunities can easily exceed the entire value of the original venture. In Meinhard, the initial lease had been for $55,000, while the new one was for $350,000 to $475,000; the initial building improvements had been for $200,000, but were now to cost $3,000,000.

B. Evolution of the COW: A Brief History of Endeavors to Contract Out of the Corporate Opportunity Doctrine

As noted in our discussion above, the COD has always permitted boards of directors to “reject” a corporate opportunity ex post—after it has emerged and has been properly presented to the company by a fiduciary interested in pursuing it personally. Just as with other forms of independent board dispensation, however, this authorization power historically did not apply to the prospective (or ex ante) waiver of the doctrine as to opportunities or projects that had yet to arise. In fact, the notion that parties might contract around (or out of) the duty of loyalty in advance was traditionally considered anathema to foundational commitments of corporate law, where the duty of loyalty is one of its few mandatory components. For the most part, that is still how much of fiduciary law operates (at least in Delaware corporations). But the late twentieth century bore witness to several early attempts to chisel the edges of the status quo, at least insofar as it pertained to corporate opportunity waivers. The judicial response to those early attempts, in turn, arguably catalyzed the subsequent statutory innovations.

1. Primordial COWs

Prior to the amendment of Delaware’s code in 2000, no specific statutory authority empowered companies explicitly to contract out of the COD in advance. A

---

45 249 N.Y. 458 (1928). Of course, the Great Depression ended up making the Meinhard-Salmon extended venture a disastrous failure.
46 Id. at 464.
48 Sutherland v. Sutherland, 2009 WL 857468, at *4 (Del. Ch. Mar. 23, 2009) (“While … a provision [limiting the fiduciary duty of loyalty] is permissible under the Delaware Limited Liability Company Act and the Delaware Revised Uniform Limited Partnership Act, where freedom of contract is the guiding and overriding principle, it is expressly forbidden by the [Delaware corporate statute]”). There is some variation among states, to be sure, but the non-waivability of the duty of loyalty appears relatively constant. See, e.g., NRS 78.138(7) (imposing a floor of liability on directors for breach of fiduciary duty accompanied by intentional misconduct, fraud or a knowing violation of law); In re Amerco Derivative Litigation, 2011, 252 P.3d 681 (Nev. 2011) (reversing dismissal below and finding that plaintiffs adequately plead a breached duty of loyalty for corporate opportunity appropriation under Nevada law).
company motivated to do so in a legally legitimate fashion had few if any options, save a “nuclear” one: A corporation could – in many states – attempt to cabin the breadth of the doctrine by narrowing the corporate purpose articulated in its charter to specified lines of business, effectively using that scope limitation to cabin the reach of all corporate activity, including the COD. Such measures, however, invite a host of other ultra vires challenges to corporate decision making—obstacles that have caused limited-purpose provisions to be disfavored and exceedingly rare in modern times. Indeed, conventional corporate charter wisdom has long advocated extremely broad purpose provisions, authorizing the corporation to engage in “any lawful act or activity” for which corporations may be organized under the applicable corporate statute.49

A more tailored form of carve out, on the other hand, had speculative legal validity: Prior to 2000, Delaware statutes did not explicitly permit (or even appear to contemplate) contracting out of the COD. On the other hand, neither did Delaware law unambiguously prohibit the practice. Towards the end of the twentieth century, several corporations began to experiment with such provisions—experiments that inevitably attracted legal challenges. Perhaps the best known example was the 1989 Delaware Chancery Court decision in Siegman v. Tri-Star Pictures, Inc.50 Siegman was a putative class action asserting a Revlon challenge to a proposed combination between Tri-Star Pictures, Inc. (“Tri-Star”),51 Coca-Cola, and Time. Under the terms of the contemplated transaction, Tri-Star acquired the entertainment assets of Coca-Cola, and Coca-Cola received a large number of shares of newly issued Tri-Star common stock.52

The plaintiffs challenged the validity of several proposed amendments to Tri-Star’s certificate of incorporation (executed as part of the combination). One such amendment purported to eliminate liability for Tri-Star’s directors for breach of the duty of loyalty under specified circumstances involving the appropriation of corporate opportunities.53 Another amendment provided that neither Coca-Cola nor Time, as significant block stockholders of Tri-Star, would be liable for any breach of fiduciary duty stemming from having pursued a corporate opportunity belonging to Tri-Star.54 The business combination was approved by both Tri-Star and Coca-Cola, and the proposed amendments were subsequently adopted by shareholders.

49 See generally 1A FLETCHER CYC. CORP. § 91 (discussing the near ubiquity of general purpose corporate statutes, including in Model Business Corporations Act). See also 1 CORP. FORMS § 1:13 (noting that “Present practice, which is permitted by most state statutes, is to simply include a sentence providing that the corporation can engage in any other activity permitted by law”). See id. § 1:16 (offering standard form language for New York corporations: “To engage in any lawful act or activity for which corporations may be organized under the Business Corporation Law, provided that the corporation is not formed to engage in any act or activity requiring the consent or approval of any state official, department, board, agency or other body without such consent or approval first being obtained.”)
51 When it formed in 1985, Tri-Star was the first major new movie studio since RKO was formed in 1927.
52 A substantial portion of the opinion (denying a motion to dismiss) is devoted to that issue, and is beyond our remit for current purposes. Siegman, 15 Del. J. Corp. L. at 218.
54 Id.
The gravamen of the complaint centered on the director provision, asserting that the COW purported to eliminate and/or limit liability in a way that was simply impermissible under Delaware law. Specifically, § 102(b)(7) of the Delaware General Corporation Law articulated what were (at the time) the exclusive circumstances where a charter could (and could not) eliminate or limit the personal monetary liability of a director for breach of fiduciary duty. The statute provides express limitations on exoneration provisions and excludes any waiver “(i) For any breach of the director’s duty of loyalty to the corporation or its stockholders.”55 Effectively, the plaintiffs argued that the COW amendment purported to do exactly this: reduce the directors’ liability exposure for a particular type of duty of loyalty breach (an appropriation of corporate opportunities), a move that the plaintiffs argued transgressed the immutable boundaries of § 102(b)(7). The defendants countered that the provision was valid and enforceable under Delaware law, and they moved to dismiss.

Then-Vice Chancellor Jacobs sided with the plaintiffs, noting that the appropriate judicial analysis for a motion to dismiss in this context “requires that the motion must be denied if under any plausible construction or operation,” the COW “arguably would contravene” Delaware law.56 Employing this analytical approach, Jacobs determined that at least one plausible set of facts would – under the articulated terms of the charter provision – eliminate or limit the liability of Tri-Star directors for breach of their fiduciary duty of loyalty. Indeed, Jacobs envisioned a very general scenario as violating § 102(b)(7), where a director appropriated for herself or her other employer a business opportunity that rightly belonged to Tri-Star, but which merely had not been offered to that director in her capacity as a Tri-Star director or in writing. Finding such a result to be impermissible under the limits established by § 102(b)(7), Jacobs denied the defendants’ motion to dismiss.57

2. Legalizing COWs in the DGCL

Siegman and its progeny58 substantially put to rest the question of how and when corporate opportunities were waivable. Under any fair reading of the opinion, the duty of loyalty was simply not contractible, be it through a corporate governance provision, via a board resolution, or through a contractual provision. In the ensuing decade, the Siegman opinion stayed in full force and was rarely discussed by subsequent judicial opinions (inside or outside Delaware).

---

57 Siegman, 15 Del. J. Corp. L. at 236. As the Chancery Court put it, “Article Sixth would eliminate or limit the liability of Tri-Star directors for breach of their fiduciary duty of loyalty - a result proscribed by § 102(b)(7).” It bears observing that Jacobs was more sympathetic to a different contractual provision that purported to limit or eliminate directorial liability to the fullest extent permitted by the Delaware General Corporation Law in the event it were amended in the future. Here, Jacobs found that neither the statute nor its underlying policy forbids such prospective planning in legislative enactments or amendments.
58 The term progeny is somewhat of a stretch. There were precious few post-Siegman cases that squarely dealt with advance COWs until after the amendment of the DGCL in 2000 (even though citations to the case made frequent appearances in practitioner journals and law reviews). Thus, much of the practical wake of Siegman was the shadow it appears to have cast over corporate conduct for the ensuing decade, an inference bolstered by the legislative history of the ensuing reform (discussed below).
By the end of the twentieth century, however, market dynamics began biting at the jurisprudential heels of the Siegman approach. The dot-com era of the 1990s ushered in a wave of novel market-mediated corporate structures, including spin-offs, partial IPOs, venture capital, private equity, and equity carve-outs. Many of these innovations resulted in extended families of corporate affiliates with partially overlapping ownership, partially overlapping board membership, and partially overlapping lines of business. Such structures, in turn, placed considerable stress on the canonical “undivided-loyalty” model of corporate opportunities. Any time a fiduciary’s duties extended to multiple common entities (as was increasingly frequent), she faced the unwinnable prospect of carving up what was judicially indivisible: her loyalty. Consider, for example, the conundrum of allocating corporate opportunities between a parent and its partially owned subsidiary, both operating in a similar industry and sharing common board members and officers. How might those overlapping fiduciaries (or for that matter, the parent, as the dominant shareholder of the subsidiary) comply with their simultaneous duties of “undivided loyalty” between the two firms? How should they go about allocating corporate opportunities?

These questions are profound and probably unanswerable. It has long been recognized that the undivided-loyalty model is simply not well adapted for fiduciaries shared by two companies. In fact, the canonical approach may be the least attractive from the parties’ perspectives, since a time-honored prescription for conduct of “dual agents” under fiduciary law is to disclose the corporate opportunity to both interested corporations, effectively encouraging the two to compete with one another for the new business prospect. While such competition is no doubt attractive to counterparties in the business opportunity (offering significant transactional surplus), it seems an unlikely governance feature for augmenting the combined welfare of the fiduciary and the two beneficiaries of her duties.

Nevertheless, by the turn of the century, the corporate structures described above had become increasingly common. Two high-stakes cases during that era – Thorpe v. CERBCO and In Re Digex – help underscore the resulting challenges. Both cases focused centrally on corporate opportunities claims made by shareholders of a controlled subsidiary, asserting that the parent had usurped a corporate opportunity related to an acquisition of the subsidiary. In both cases, the plaintiffs alleged that the controller had commandeered takeover negotiations with a third party buyer, redirecting the buyer’s interest towards the parent and away from the subsidiary, thereby fleecing the subsidiary’s minority shareholders of their impending control premium. In both cases, the corporate opportunities claims narrowly lost, under the theory that the prospective acquisition deal was not a corporate opportunity since the parent possessed the power (and the right) to use its voting shares to veto any proposed transaction at the subsidiary level. Nevertheless, both opinions recognized the generic and intractable challenges posed by corporate opportunities claims in cases involving ownership/board/industry

59 See, e.g., Meinhard v. Salmon, 164 N.E. 545, 547 (“The trouble about [defendant’s] conduct is that he excluded his coadventurer from any chance to compete, from any chance to enjoy the opportunity for benefit that had come to him alone by virtue of his agency. This chance, if nothing more, he was under a duty to concede.”); Energy Resources v. Porter, 438 N.E.2d 391 (Mass. App. 1982).
60 676 A.2d 436 (Del. 1996).
61 789 A.2d 1176 (Del. Ch. 2000).
overlap. The cases served up a sobering reminder of the uncomfortable indeterminacy of corporate opportunity claims when firms have overlapping dominant ownership and/or boards. They also made apparent that there might be some value to allowing parties to pre-arrange how they would divide property rights over corporate opportunities. Thusly was the stage set for a legal reform push as we entered the twenty-first century.  

The wait was not long. In the summer of 2000, the Delaware Assembly amended the state’s statutes to add subsection (17) to § 122 of the Delaware General Corporation Law (“DGCL”), explicitly permitting COWs. The statutory location is a notable one. Section 122 is a general and longstanding provision whose purpose is to articulate a variety of powers possessed by Delaware corporations. Many of these powers are fundamental (such as the right to hold property, the right to enter contracts, and the right to sue and be sued). The new subsection (17), however, was different and somewhat sui generis, consisting of the sole provision in the section that concerns fiduciary duties. The subsection provides that a Delaware corporation has the power to:

(17) Renounce, in its certificate of incorporation or by action of its board of directors, any interest or expectancy of the corporation in, or in being offered an opportunity to participate in, specified business opportunities or specified classes or categories of business opportunities that are presented to the corporation or one or more of its officers, directors or stockholders.

The legislative synopsis accompanying the amendment is worth quoting in full:

The subsection is intended to eliminate uncertainty regarding the power of a corporation to renounce corporate opportunities in advance raised in Siegman v. Tri-Star Pictures, Inc., C. A. No. 9477 (Del. Ch. May 5, 1989, revised May 30, 1989). It permits the corporation to determine in advance whether a specified business opportunity or class or category of business opportunities is a corporate opportunity of the corporation rather than to address such opportunities as they arise. The subsection does not change the level of judicial scrutiny that will apply to the renunciation of an interest or expectancy of the corporation in a business opportunity, which will be determined based on the common law of fiduciary duty, including the duty of loyalty.

Several aspects of the amendment and its synopsis warrant elaboration. First, and most obviously, the synopsis makes clear that the amendment was meant to repudiate the then-decade-old Siegman approach. Indeed, the amendment specifically permits enforceable COWs under Delaware law, a position that—both before and after Siegman—most had considered untenable.

Second, the new section explicitly applies symmetrically to all corporate fiduciaries, including officers, directors, and dominant/controlling shareholders. By contrast, the statutory provision permitting the duty of care waivers is far narrower. It

---

62 See Lewis S. Black, Jr. & Frederick H. Alexander, Analysis of the 2000 Amendments to the Delaware General Corporation Law 1, 2 (Aspen Corp. Serv. Aug. 1, 2000) (contemporaneous commentary on § 122(17)’s enactment suggested the sale by a parent of minority interests in a subsidiary as an important business context affected by the statute’s adoption).

applies only to monetary damages claims against corporate directors; it does not extend to either injunctive relief of any kind or claims for monetary damages lodged against officers or dominant shareholders. This asymmetry has been consistently recognized by the Delaware courts (even if periodically scorned by commentators).

Third, consider the level of specificity required for a corporate opportunities waiver to be effective under the statute. On its face, the amendment requires a COW to be worded with some specificity, identifying business opportunities or classes/categories of business opportunities that would be subject to waiver. This construction appears in tension with an expansive, “blanket” waiver, in which a corporation, say, disclaims all corporate opportunities, or even a broad waiver purporting to disclaim all opportunities except a specified set of carved out exceptions. In contractual parlance, the wording of the section appears at least facially to suggest a type of sticky default rule that does not invite corporations to invert or “flip” the default, either in toto or in substantial part.

Fourth, consider the means and location for executing an effective COW. The text of the section permits a waiver to be included in a corporation’s charter, but it also allows a waiver to simply be adopted by action of the board of directors. Bearing in mind that a charter amendment cannot generally be promulgated exclusively by action of the board once stock is sold, the portion that authorizes an action of the board opens up tremendous latitude, permitting COWs to be couched in a contract approved by the board, a board-promulgated bylaw (if the board has such power under the charter), a board resolution, or any other declarative action promulgated by the board. The fact that a COW may be executed outside the charter context is notable, since the other principal means by which corporations may waive fiduciary duties (the duty of care) specifically requires a charter provision. Indeed, it was the prohibition of waiving the duty of loyalty under § 102(b)(7) that formed the basis of the Siegman opinion in the first place.

---

64 DGCL § 102(b)(7) (providing that the certificate of incorporation can include “[a] provision eliminating or limiting the personal liability of a director to the corporation or its stockholders for monetary damages for breach of fiduciary duty as a director . . .”).
66 As we discuss below, however, a portion of the legislative synopsis casts some doubt on the requirement of specificity for an effective COW. See infra text accompanying notes __.-__.
67 See DGCL § 242(b).
68 DGCL § 109 allows the certificate of incorporation to grant the board concurrent power to pass, amend, and repeal corporate bylaws.
69 DGCL § 102(b)(7).
Section 122(17) is thus in some conspicuous ways broader than conventional waivers of the duty of care.

Finally, while § 122(17) grants increased latitude for enforcing valid COWs, the legislative synopsis notes that the initial adoption of a COW is subject to traditional fiduciary principles – just as the renunciation of an opportunity when it arises. Thus, should a financially conflicted board decide to adopt a COW without first seeking to cleanse the decision through conventional means (such as a vote of disinterested directors or shareholders), then the very act of executing the COW could be challenged under Delaware’s stringent entire fairness standard (and possibly invalidated).

3. Subsequent Delaware Litigation

Although Delaware’s amendment arrived with great fanfare, the new amendment’s footprint in case law and commentary has been surprisingly faint. In the decade and a half since § 122(17) was promulgated, the statute appears to have been invoked in only a single Delaware case and in only a few secondary sources.71

The 2009 Chancery Court opinion in Wayne Cty. Employees’ Ret. Sys. v. Corti,72 appears to be the only Delaware opinion to date to engage the statutory framework for COWs explicitly (although cursorily). Like Siegman, Corti was a purported shareholder class action challenging a business combination involving a waiver of corporate opportunities. The combination called for Vivendi S.A. (“Vivendi”) to transfer its subsidiary Vivendi Games, Inc. to Activision, Inc. (“Activision”) in return for newly issued shares of Activision and a post-closing tender offer by Vivendi for up to half of Activision’s remaining shares.73 Together, Vivendi’s acquisition of shares through the business combination and back-end tender would result in Vivendi acquiring a majority of Activision voting stock, which it then renamed Activision Blizzard. The charter of the surviving corporation (Activision Blizzard) included a broadly-worded COW.74

---

70 See DGCL § 144.
71 A small number of other cases discuss waivers fleetingly, but with no reference to the DGCL. By contrast, the enabling statute for duty of care waivers has been invoked in at least 165 cases and 120 secondary sources over that same time period.
72 No. CIV.A. 3534-CC, 2009 WL 2219260, at *1 (Del. Ch. July 24, 2009), aff’d, 996 A.2d 795 (Del. 2010).
73 Id. at *1.
74 “(b) In the event that a director or officer of the Corporation who is also a director, officer or employee of Vivendi acquires knowledge of a potential transaction or matter which may be a corporate opportunity for both the Corporation and Vivendi (a “Mutual Corporate Opportunity”), such director or officer shall to the fullest extent permitted by law have fully satisfied and fulfilled his fiduciary duty with respect to such Mutual Corporate Opportunity, and the Corporation to the fullest extent permitted by law waives and renunciates [sic] any claim that such Mutual Corporate Opportunity constituted a corporate opportunity that should have been presented to the Corporation, if such director or officer acts in a manner consistent with the following policy: a Mutual Corporate Opportunity offered to any person who is an officer or director of the Corporation, and who is also an officer, director or employee of Vivendi, shall belong to Vivendi, unless such Mutual Corporate Opportunity was expressly offered to such person in his or her capacity as a director or officer of the Corporation (an “Activision Opportunity”), in which case such Activision Opportunity shall not be pursued by Vivendi. In the event Vivendi decides to pursue any Mutual Corporate Opportunity (other than an Activision Opportunity), then, subject to any contractual restrictions on Vivendi with respect to confidentiality, Vivendi shall provide prompt written notice to the Corporation of such
Plaintiffs—shareholders of the target Activision—alleged, *inter alia*, that the COW was invalid under Delaware law, because it contravened § 122(17)’s limitations through its sweeping language. The provision, plaintiffs contended, failed to specify explicitly which corporate opportunities (or classes/categories thereof) were being renounced as the statutory text arguably requires.\(^{75}\) Rather, the provision utilized the opposite, *holus-bolus* grammatical construction, categorically sweeping away all liability exposure with the *exception* of opportunities that were expressly offered to Activision fiduciaries in their capacity as such.\(^{76}\) In short, plaintiffs averred, the Activision waiver fell outside the bounds authorized by § 122(17).

Chancellor Chandler remained uncowed, denying plaintiffs’ motion for a preliminary injunction of the contemplated transaction, and holding that “[t]he mere existence of [the broadly worded COW] does not threaten plaintiff with harm that justifies expending judicial resources to render a declaratory judgment on the issue of whether the corporate opportunities allegedly renounced by [the COW] are sufficiently ‘specified.’”\(^{77}\) Any plausible harm to plaintiff due to the wording of the waiver, Chandler concluded, “is too remote and speculative to justify rendering a declaratory judgment, and plaintiff is not entitled to a declaratory judgment merely because it is able to conjure up hypothetical situations in which the challenged provisions may be applied contrary to Delaware law.”\(^{78}\) Ultimately, Chancellor Chandler took no position on the question of whether such hypothetical situations might actually arise down the road, in which case the Activision-Blizzard COW might be invalidated under the statute. But any such claim would have to wait for an *actual* disputed business opportunity.

It is unclear how the Court might have wrestled with the *Corti* COW had the case presented an actual contested business opportunity. While the text of § 122(17) could arguably favor the plaintiffs’ preferred narrow construction, the legislative synopsis suggests that the plaintiffs’ position faces an uphill battle. The synopsis offers several characterizations of how corporations’ power to renounce business opportunities in advance might be used: “categories of business opportunities may be specified by any manner of defining or delineating business opportunities or the corporation’s or any other party’s entitlement thereto or interest therein, including, without limitation, by line or type of business, identity of the originator of the business opportunity, identity of the party or parties to or having an interest in the business opportunity, identity of the recipient of the business opportunity, periods of time or geographical location.”\(^{79}\)

After *Corti*, there appear to be no other opinions endeavoring to interpret § 122(17). Although parties in a few post-*Corti* cases have advanced theories touching on the applicability / scope of a purported waiver, none of these opinions has discussed the section explicitly, and in each of them the waiver argument has been either struck down.
on other grounds or avoided so as to shed little additional light on how § 122(17) is likely to be applied in future Delaware cases.80

The paucity published jurisprudence around COWs does not imply, however, that all important legal questions pertaining to waivers have been answered—far from it. One particularly intriguing question pertains to the (so-called) duty of good faith, which entered the scene years after § 122(17)’s promulgation.81 By all accounts, good faith is thought to be an immutable82 and a subspecies of the duty of loyalty (rather than as a freestanding fiduciary obligation).83 Moreover, under Delaware jurisprudence, the good-faith duty proscribes conduct that (inter alia) harms the corporation and is motivated by a fiduciary’s “subjective bad faith.”84 It seems entirely possible to characterize corporate opportunity diversion as embodying precisely this type of deliberate bad faith, in which the corporation is “harmed” when the fiduciary willfully deprives it of a lucrative business opportunity. How might such an allegation proceed if the corporation had also executed a COW that covered the fiduciary? On the one hand, the waiver’s power derives directly from the statute; but on the other, the statute never specifically carves out good faith claims. While sound arguments can clearly be made in either direction, a definitive answer must await clarification by the Delaware courts—or legislature—as to whether § 122(17) also (unwittingly) contractualized part of the duty of good faith.

4. Non-Delaware COWs

Delaware was the clear pioneer in authorizing corporate opportunity waivers through statute. However, not long after the Delaware reforms took root in 2000, other states began to follow suit. Table 1 offers an overview of the states that have followed Delaware to date in amending their statutory frameworks explicitly to allow COWs: Note from the Table that the other states promulgating waiver statutes represent more of a trickle than they do a flood. Promulgating states moved in relatively evenly spaced intervals, with no two states adopting waiver statutes in the same calendar year. It is also worth noting that outside of Delaware, only a few adopting states (Maryland and Nevada) are considered “bellwether” states for incorporation. Notably absent from the list are New

---

80 One notable 2012 case that takes up the enforceability of a COW most directly is Dweck v. Nasser, 2012 WL 161590 (unpublished opinion, Jan. 2012). In Dweck, the CEO / minority shareholder of a Delaware corporation was found to have appropriated the corporate opportunity doctrine in forming several competing children’s retail businesses. The defendant asserted that her conduct was permitted under a waiver, but Vice Chancellor Laster disagreed, noting that the purported waiver had never been executed by the plaintiff / controlling shareholder. And, while the defendant and the plaintiff had evidently executed a COW in the governance documents of a separate company they had formed, Laster held that such a provision was not binding on the fiduciaries of the instant corporation. The court never reached the issue of judicial construction of the COW against the statutory language in § 122(17).

81 See, e.g., In re Walt Disney Co. Derivative Litig., 906 A.2d 27, 66 (Del. 2006).

82 Stone ex rel. AmSouth Bancorporation v. Ritter, 911 A.2d 362, 367 (Del. 2006) (a “section 102(b)(7) provision . . . can exculpate directors from monetary liability for a breach of the duty of care, but not for conduct that is not in good faith or a breach of the duty of loyalty.”).

83 Stone, 911 A.2d at 370 (“the requirement to act in good faith ‘is a subsidiary element[,]’ i.e., a condition, ‘of the fundamental duty of loyalty.’”) (citations omitted).

84 In re Walt Disney Co. Derivative Litig., 906 A.2d 27, 66 (Del. 2006). Another focus of the good faith duty is deliberate inaction by a corporate fiduciary in the face of a known duty to act. Id.

*No statute explicitly authorizes bylaw waivers, but in these states, (i) waiver is permitted by an action of the board and (ii) bylaw amendment power is or can be extended to the board, so bylaw waiver may be part of a charter provision, and cannot be adopted by action of the board. Second, insofar as a COW reaches officers and dominant shareholders, the statute requires specific board approval (effectively a "reaffirmation") of the waiver when a business opportunity arises that the officer/dominant shareholder wishes to pursue.

**Shareholders not specifically mentioned in statute

***"Specified" not present; but refers to "classes or categories"

****Board must specifically approve application of waiver as to an officer and/or related person of an officer

Table 1: Statutory Authority for Corporate Opportunity Waivers, By State

The structures of the follow-on statutes are similar – but not always identical – to Delaware’s. Oklahoma, Kansas, New Jersey and Maryland each have provisions that closely track § 122(17) in all respects. However, there are also variations providing more or less latitude. For example, Maryland and Washington omit the express modifier “specified” in describing the scope of waivable classes or categories of business opportunities. In addition, Missouri and Washington extend the scope of permissible waivers to cover others beyond officers, directors, and dominant shareholders. In Missouri, in fact, a COW may also cover any agent or employee, and Washington allows COWs to cover “any other persons” beyond the usual suspects. At the same time, Washington’s statute is also more restrictive in at least two ways. First, the waiver must be part of a charter provision, and cannot be adopted by action of the board. Second, insofar as a COW reaches officers and dominant shareholders, the statute requires specific board approval (effectively a “reaffirmation”) of the waiver when a business opportunity arises that the officer/dominant shareholder wishes to pursue.

Given the paucity of developed case law even in Delaware, the leadership position that Delaware generally has in establishing precedents, and the fact that the other promulgating states moved later to introduce their amendments, it would be reasonable to expect the case law to be even less developed outside Delaware. Our investigation reaffirms this conjecture: Beyond Corti, we were unable to find any reported cases interpreting the statutory provisions described in Table 1.

The lack of attention COWs have received in judicial opinions and commentary might lead one to believe that the authorizing statutes have simply not created much

85 One must not make too much of these seemingly more expansive provisions, particularly in the light of the fact that non-managerial employees, independent contractors, and other non-fiduciaries generally owe weaker (if any) fiduciary duties to the corporation as principal. See Mattel, Inc. v. MGA Entertainment, Inc., 782 F.Supp.2d 911 (2011). Moreover, such employees may be protected by other statutory mandates that help ensure their rights to compete with the principal. See, e.g., CAL. BUS. & PROF. CODE § 16600 (prohibiting non-compete restrictions as a matter of public policy for California employees, regardless of state of incorporation). While a version of the corporate opportunity doctrine certainly applies to such actors, for them it is a far more forgiving legal proscription.
interest among eligible firms, and that corporations have by and large declined the invitation to waive or truncate the application of the corporate opportunity doctrine as to their fiduciaries.

II. THEORY: EFFICIENT CONTRACTING OVER CORPORATE OPPORTUNITIES

The immense unpredictability of the corporate opportunity doctrine has long generated interest among commentators in developing a coherent account of the doctrine, which could serve as a normative lodestar for courts. Among these accounts are contractarian approaches that seek to fashion a corporate opportunities doctrine based on precepts of efficient contract design between a corporation and its fiduciaries: that is, how would they plausibly bargain over their prospective rights to corporate opportunities ex ante, given their capital constraints, information constraints, and relative bargaining power? While not unique among conceptual approaches, the contractarian account can be of considerable value to efficiency-minded courts attempting to adjudicate the thorny equities around disputed claims of ownership of new business prospects.

A significant limitation of the contractarian account, however, was that the law traditionally prohibited parties from using contracts to alter the relevant fiduciary obligations. Thus, if the contractarian account was to have any sway, it would be through the immutable precepts of the doctrine as announced and understood by courts. Since Delaware’s 2000 reforms, of course, jurisdictions have begun to permit parties to contractualize corporate opportunities. With this change, the contractarian project acquired far greater significance, both as a normative guidepost for doctrine and as a vehicle for predicting – as a positive matter – the incidence of COWs as well as their qualitative characteristics. Section A of this Part briefly outlines a contractarian account, adopting and extending a theoretical framework originally developed by one of us in prior work. 86 Section B suggests why it may frequently be important that corporations be able to allocate corporate opportunities ex ante, rather than merely at the time of board presentation – ex post – which historically was the sole tool available.

Before proceeding, however, we feel compelled to reiterate a lawyerly disclaimer from the introduction: Our conceptual arguments for how COWs could be efficient should not be understood to evince a conviction that they are efficient. That conclusion simply does not follow. Indeed, the agency cost paradigm remains a powerful frame for corporate law, and it is entirely possible that the main reason for the adoption of COWs is managerial opportunism. 87 Indeed, some empirical work on LLCs suggests that entities that contract around fiduciary defaults often do so at their own peril and with wealth destructive consequences. 88 Instead, our aim here is far more modest: we aspire to show

---

86 For a more fulsome exposition, see Talley, supra note 39. Recall that Delaware amended its statute in 2000. See supra notes 62-64 and accompanying text.
that there exist plausible cases where waivers can augment shareholder-value. Ultimately, the normative desirability of COWs cannot be settled on theoretical grounds and requires empirical investigation (which we turn to in Part III).

A. Framework

We begin with a simple framework involving only two parties: (1) a single “principal” (referred to either as Player “P”, or the “firm”), and (2) a single agent (Player “A”), who ostensibly works on P’s behalf. In the corporate opportunities context, the principal will generally refer to the focal corporate entity, while A is meant to represent an officer, director, or dominant shareholder of P. One of the principal’s key economic functions (and a source of value creation) comes from evaluating new business “projects” that are presented to the firm, and taking on those projects that are sufficiently well-suited to the firm’s capabilities (generating a net profit in the process).

Assume (for simplicity) that each new project yields revenues of $100 (in expectation). Different projects, however, require different mixes of skills and specialties. Accordingly, the net revenues that P can capture from each project vary heterogeneously across projects. Some projects, for example, may be directly in the firm’s “sweet spot” and maximally profitable, while others are so far afield from the firm’s area of specialty that they are wholly unprofitable. We use the Greek letter $\theta$ to represent the specific “type” of skill/specialty requirements entailed in a project presented to the firm. To fix ideas, suppose (arbitrarily) that the value of $\theta$ describes the percentage composition of verbal (relative to technical) skills that the project requires. When $\theta = 0\%$ the project is entirely technical in nature, while when $\theta = 100\%$ it is entirely verbal. Projects with intermediate values of $\theta$ entail a proportional mixture of technical and verbal requirements. Suppose that ex ante, the next project’s requirements are probabilistically distributed evenly (or “uniformly”) between 0 and 100%.

Project heterogeneity is crucial to how corporate opportunities should be allocated because the project’s net profitability turns on how closely aligned it is with the principal’s (or the agent’s) skill sets. Suppose (for concreteness) that the principal specializes in completing projects that are 50% verbal in nature (i.e., projects of type $\theta = 50\%$) and can complete those projects at a relatively low cost, assumed (arbitrarily) to be $20, for expected net revenues of $80. Should the offered project differ from the principal’s area of expertise, P could still conceivably accept it, but only by bearing an adaptation cost away from her “sweet spot” to do so. Namely, it costs the principal an additional $4 to for each percentage increment she moves away from her specialty. For instance, to take on a project with a forty percent concentration of verbal tasks ($\theta = 40\%$), P would need to bear a cost of $60 (i.e., $20 in fixed costs plus an additional $40 representing the cost of moving 10 percentage points from her specialty at $4 per point). In mathematical terms, the principal’s cost of taking on a given type of project can be summarized by the cost function $C_P(\theta) = 20 + 4|\theta - 50|$. Figure 1 below contains a

---

89 We address more complex scenarios in the next subsection.
90 Although we hypothesize specific numbers and linear functional forms for purposes of discussion, the framework easily generalizes to other formats. See Talley, supra note 39.
Diagrammatical representation of the firm’s cost and profit structure given these parameters. This cost structure is intended to capture the intuition behind a firm’s “line of business”: Although the principal operates most profitably when the project coincides with its “sweet spot” of expertise (i.e., where \( \theta = 50\% \)), \( P \) can nonetheless adapt its production techniques to take on projects that are further afield. Doing so, however, comes at a cost, which increases with the “distance” between the firm’s specialty and the requirements of the project (and thus the degree of adaptation required). Given the numerical figures posited above, the firm would never take on any negative-value project where \( \theta < 30\% \) or \( \theta > 70\% \). In an economic sense, then, the firm’s effective “line of business” is that set of projects the firm would have an economic incentive to pursue – in Figure 1, this would correspond to any project whose requirements fell on the region defined by \( 30\% \leq \theta \leq 70\% \) (a region shaded in light grey).

![Figure 1: Representation of Principal’s Cost Structure / Line of Business](image)

For our purposes, the agent’s key role at the firm is to attract and receive information about new potential business projects that arrive and that may be of interest to the firm. If merely identifying new prospects was all the agent could do, then there would be no need for the corporate opportunity doctrine. The problem in both real-life and our model is that the agent’s ability to spot and attract new business prospects will often coincide with a private ability to take on projects herself, outside of the productive infrastructure of the principal. Such a capacity for the agent is easy to imagine, such as when the agent/fiduciary is a controlling corporate shareholder of the principal, or the principal of a financial firm that also invests in competitors.

Thus, the agent may have her own interest in pursuing the project on the outside (either individually or through a firm in which she has an interest). In particular, suppose the agent faces a fixed cost of \( x \) to take on any new project (a cost figure that need not correspond with the principal’s fixed cost of \$20\)). Suppose further that the agent’s “sweet spot” within her area of specialty is denoted by \( z \) (which also need not correspond to the firm’s sweet spot of 50%). Finally, suppose that the agent’s marginal cost of adaptation were \( b \) dollars for each percentage point difference between the project and the agent’s
own specialty (where the value of $b$ similarly need not correspond to the firm’s marginal cost of adaptation of $4$ per percentage point). All told, then, the agent’s cost of taking on a project of type $\theta$ can be summarized by the cost function $C_A(\theta) = x + b|\theta - z|$.

Standard economic intuition suggests that, so long as the characteristics of the offered project (reflected in $\theta$) are observable by both sides or readily verifiable by a third-party adjudicator, then an optimal contract allocates control over the project to the lowest cost producer as between $P$ and $A$. Indeed, this division uniquely maximizes the total joint surplus that is available to the principal and agent collectively. Under such a division of authority, the parties can use an assortment of side payments (such as wages, licensing fees, or transfer pricing) to divide the contingent revenues from the undertaken project in any fashion they wish. In prior work, one of us has already demonstrated this proposition formally.\(^91\)

Moreover, and central to our purposes, it is possible to use a COW – if properly crafted – to achieve the optimal allocation of authority over prospective projects. Within our framework, the particular form of the optimal COW depends on the relative configurations of the principal’s and agent’s adaptation costs. Figure 2 illustrates four archetypal configurations, each of which gives rise to a different type of optimal waiver; the scope of the optimal COW is illustrated with the dark gray bands overlaying the principal’s line of business (in light gray). In the Figure, we assume the principal has the same specialization / adaptation costs as articulated above, and we vary the agent’s cost structure (by varying the values of $x$, $z$, and $b$). Figure 2a assumes that the agent’s specialty is at $x=40\%$, that she faces a fixed cost of $z=80$ to take on the project, and that her marginal cost of adaption is the same as the principal’s, at $b=4$. Because of the agent’s high fixed costs, in this configuration it turns out that there is no project that the agent would ever be more efficient at taking on than the principal, and thus it would never be optimal for the principal to waive any opportunities falling within its line of business. Figure 2b maintains the agent’s specialty at $x=40\%$, but assumes a far lower fixed cost (of $z=20$) and a higher marginal cost of adaptation (of $15$ per $1\%$ adaptation). Here, the optimal COW will tend to permit the agent to appropriate a specific class of projects clustered near her specialty, but it will reserve for the principal rights as to all other projects. Such a provision would waive “only as to” a specified class or margin of projects closely matching the agent’s sweet spot.\(^92\) Figure 2c continues to maintain the agent’s specialty at $x=40\%$, but assumes a fixed cost of $70$ and a marginal adaptation cost of $0.60$. For this configuration, the agent’s fixed cost is sufficiently high that the principal remains the most efficient producer only near its own sweet spot; however, the agent’s low marginal cost of adaptation gives her a cost advantage for projects that are near the periphery of the principal’s line of business. This configuration would be consistent with a waiving “all but” a specified margin of projects near the

\(^91\) See Talley, supra note 39, at 357 (Proposition 1). Talley also analyzes the optimal contracting problem when the characteristics of the project ($\theta$) are observable only to the agent. In such a circumstance, the optimal contract effectively gives the agent a “call option” to appropriate the corporate opportunity individually in return for paying an exercise price whose value is set by the various cost configurations of the principal and the agent. Because we see little evidence of such contractual structures in our data, we suppress that analysis here and concentrate on the complete information case, which appears to have ready instantiations in observed data.

\(^92\) In the figure, this class corresponds to projects falling on the interval $36.3\% \leq \theta \leq 42.1\%$. 
principal’s specialty. Finally, Figure 2d assumes an agent specialty very close to the principal’s (of $x = 48\%$), a lower fixed cost (or $z =$ $10$), and the same marginal adaptation cost. For this configuration, the agent is always the lowest cost producer, and an optimal COW would effectively give her free rein to pursue any and all projects, “to the fullest extent” allowed by law.

Figure 2: Optimal COWs (Gray Bands) for Various Principal-Agent Cost Configurations

The qualitative analysis above delivers several insights about the situations where we would be likely to see different waiver configurations. First are those instances – presumably very common – in which agents would never be more efficient at pursuing a project than their corporate principal (see Panel 2a). Absent significant agency costs, such corporations will compose a universe that falls almost entirely outside our data set, simply because they will generally (and efficiently) eschew waivers. Our coding system would thus not detect corporations that mention the renunciation of business opportunities in order to specifically declare that they are not doing so. However, because non-waiver of corporate opportunities is the legal default we expect to observe few such disclosures.

Second, in situations where the agent has a lower fixed cost than her principal, the optimal allocation of new opportunities will enable the agent to pursue specific types of opportunities closely related to the agent’s specialty (see Panel 2b). An example of this could be a director who also manages a specialty enterprise on the side. For specific projects related closely to that side enterprise, the director may be the lowest cost

---

93 In the figure, the waiver would allow the agent to pursue projects falling on the disjoint intervals $\theta \leq 37.1\%$ and $\theta \geq 66.5\%$.

94 On the other hand, if the agency problem is sufficiently severe that the agent can induce the firm to cede new prospects to her (inefficiently), that cost should be observable in reductions to company value. We test this proposition empirically in Part III.
producer of a new project, and an efficiency-enhancing waiver would permit the director to pursue such projects.

Third, there are those configurations in which we might expect the fiduciary agent to more easily adapt to pursue projects outside of her specific specialty than the principal (see Panel 3c). Where the agent is more versatile than the principal, the most efficient allocation of corporate opportunities will retain a core set for the principal centered around its specialization, but will allocate the remaining opportunities to the agent – an “all but” scope for the waiver.

Two general business scenarios are plausible candidates for including agents more versatile than their principals. The first are financial fiduciaries. Venture capitalists, private equity firms, and hedge funds are all capital investors who are well-known for making major minority or controlling investments in companies as well as for placing their own principals and employees onto the boards of the companies in which they invest.95 Both the directors these firms place on a company’s board as well as the firms themselves (if their ownership interest is significant enough) can become the sponsored firm’s fiduciaries. As a result, they would be obliged under the COD’s typical strictures to present any potentially relevant new business prospects to the sponsored entity. Yet, because of the range of other companies in which these financial firms often invest – and in which they might be interested in investing – the financial fiduciary (and/or her employer) will often be more versatile than the principal. Second, partial corporate spin-offs may often create situations where parent companies remain major shareholders in a subsidiary – and thus owe it fiduciary duties – but where the parent company remains the lower-cost adapter to newly arising business opportunities.96

Finally, and most strangely, is a configuration in which all new business opportunities are waived (see Panel 4b). This scenario is slightly bizarre because if the agent is the lowest cost pursuer of all new business prospects it raises the question of why the principal is even in business. If the agent is the more efficient party to pursue all future business, then perhaps the agent should simply buy out the principal’s business. One context in which it might still make sense for a principal to exist as a going concern

---

95 See Stephan H. Coonrod and Annamarie C. Larson, Washington’s New Provisions on Advance Waivers of Corporate Opportunities: Opening the Road for Investors, Apr. 2015, K&L Gates Legal Insight (“Venture capital and private equity firms commonly finance multiple investments in the same area of activity and require a seat on the board of directors as a condition to their investment.”); Chris E. Abbinante and Jessica B. Fairchild, Sidley Austin LLP, Obtaining Advance Waivers In PE Transactions, Mar. 18, 2010; Christopher E. Austin & David I. Gottlieb, Renouncing Corporate Opportunities in Spin-offs, Carve-out IPOs and Private Equity Investments, https://vcexperts.com/buzz_articles/320 (“In the private equity or financial investor context, funds that make multiple investments in the same or similar industries may want to avoid any undue restrictions imposed by the duty of loyalty on their ability to pursue other investments, even competing ones, or to direct a particular opportunity to the entity for which it is best suited.”); Christopher K. Aidun & Ernest Cebario, Current Trends in Venture Capital Fundraising: 2002, 7 No. 2 CYBERSPACE LAW. 2 (2002) (“Every venture or strategic investor should insist that each portfolio company adopt allocation rules” under § 122(17)).

96 Christopher E. Austin & David I. Gottlieb, Renouncing Corporate Opportunities in Spin-offs, Carve-out IPOs and Private Equity Investments, https://vcexperts.com/buzz_articles/320 (“In the case of a spin-off or carve-out, the parent company, which may well be in the same or similar line of business as its subsidiary, may want to preserve its flexibility to pursue potential business opportunities that might also be of interest to the subsidiary without running afoul of its fiduciary duties.”).
but waive all business prospects is where the principal is close to capacity on current projects, but lacks the ability to scale up. The current corporate opportunity doctrine already treats such limitations of the principal as sufficient to defeat a cause of action, but a broad waiver could serve to clarify and ensure these limitations as dispositive for a factfinder.

**B. Ex Ante versus Ex Post Waivers**

The traditional corporate opportunity doctrine has always permitted a corporation’s board to “reject” a business opportunity presented to it by a corporate fiduciary, leaving the fiduciary free to pursue it herself. So a reader may reasonably ask how precisely the *ex ante* waivers authorized by § 122(17) and its ilk differ from what could be called the *ex post* waivers already countenanced at common law. After all, the *ex post* allocation of corporate opportunities to fiduciaries was permissible before § 122(17) and remains so afterward. The key feature of the traditional doctrine was that all corporate opportunities were initially allocated to the corporation. That allocation was *mandatory* in advance, but became a waivable *default* when a fiduciary actually presented a given opportunity to the board.

Advance waivers will have an important efficiency role to play precisely when it is less costly to allocate *ex ante* what could in principle be bargained over *ex post*. One might think that the common law’s preclusion of *ex ante* waivers was sensible, simply because parties will always prefer paying fiduciaries with money and retaining opportunities (renegotiating as needed later on). Corporate entities might seem uniformly to be the more diversified party and better suited to bear the risks of new business prospects. The modern corporate context enormously complicates this picture, however. If the corporate fiduciary is a larger, controlling shareholder, or a director who belongs to and implicates with her duties a private equity firm, then the fiduciary may well be more highly diversified than the company adopting a COW (especially if that company faces a high cost of insolvency). If opportunities are more efficiently allocated to fiduciaries, and this is known by both parties, then *any additional transaction cost* *ex post* may justify an appropriate *ex ante* allocation, formerly forbidden by law. None of this is to say that a default allocation of all business opportunities to a corporation’s fiduciaries is the efficient one – only that freeing corporations to replace the default allocation may sometimes produce beneficial results.

Indeed, we will see that waivers under § 122(17) differ importantly in several respects, which together can make *ex ante* waivers both less costly to adopt and which could result in different – and more efficient – allocations of corporate opportunities than the allocation resulting from *ex post* waivers.

1. **Transaction Costs**

To a large extent, the distinction between *ex ante* and *ex post* waivers hinges on evaluating the frictions of transaction costs. In an idealized Coasean world where transaction costs are zero, the timing of a waiver may not matter much: whenever it is

---

97 See supra Subsection I.A.2.
98 Id.
efficient for a corporation to renounce an opportunity in its fiduciary’s favor, it will do so, whether *ex ante* or *ex post*. In such a setting, as with many other Coasean environments, the legal rule becomes irrelevant.\(^99\) Indeed, even if transaction costs were positive but always the same across time and context, then the choice of legal default would not have great significance. In the actual circumstances of corporate life, however, there are a number of reasons to expect the presence of transaction costs to sometimes make bargaining between the board and corporate fiduciaries more problematic when done on an ad hoc basis than through an *ex ante* waiver.

Most obviously, *ex ante* waivers allow a corporation to *commit credibly* to ceding certain corporate opportunities (along with other contractual *quid pro quos*) at the moment of contracting. For instance, if the fiduciary is a controlling shareholder, it may be providing financing to a corporation years before it expects the corporation to encounter the valuable new business prospects it desires the corporation to renounce.\(^100\) This would be difficult to do exclusively with *ex post* waivers as the board could simply refuse down the road to permit a fiduciary to pursue a promised opportunity and its prior promise would be valueless. This could matter significantly if what a given fiduciary, say a controlling shareholder, sought from an investment was in important part new business opportunities it would generate. Further, without an *ex ante* waiver, the controlling shareholder would have a strong incentive to retain a 100% controlling position in order to ensure opportunities were allocated to it. With an advance waiver, however, a fiduciary can freely diversify when it is efficient for it to do so.

Advance waivers can thus significantly enhance the bargaining space – in the form of new business prospects – that a corporation has available to transfer in exchange for cheaper financing (or the service of an outstanding officer, the expert input of a venture capitalist, or the rolodex of an outside director). This is a central function of contract: to ensure that parties can credibly commit to follow through on their commercial undertakings, enabling transactions whose performances are separated in time. Without the possibility of *ex ante* commitments, financing that a fiduciary would have provided in exchange for promised opportunities may not be exchanged, resulting in foregone gains from trade.

Another limitation on *ex post* waivers is that the context of fiduciaries’ involvement in a corporation is a classic site for the fiduciary’s development of highly specialized skills and abilities. A director or officer typically invests years of work in a company and will usually acquire knowledge and abilities that are valuable at the company but are of less or no use elsewhere. A well-known hold-up problem can thus emerge. For example, the corporation may know that a fiduciary’s service to it is worth, say, $50,000, but only $30,000 to any other company. One can further assume – plausibly, in the context of at least some early-stage companies – that corporate opportunities are one of the most valuable forms of compensation a corporation has to offer. The framework developed in Section A above likewise focused on situations in which the fiduciary could, in terms of comparative advantage, simply be the *more*

---

\(^100\) There is a vast literature on credible commitments and their important role in commerce. See, *e.g.*, Ronald J. Gilson & Alan Schwartz, *Corporate Control and Credible Commitment*, 43 INT’L REV. L. & ECON. 119 (2015).
efficient party to pursue a new business opportunity. In the absence of enforceable advance waivers, the corporation may promise to provide the fiduciary with a variety of opportunities as compensation, but then fail to renounce them as anticipated.\footnote{See, e.g., Benjamin Klein et al., \textit{Vertical Integration, Appropriaible Rents and the Competitive Contracting Process}, 21 J.L. \\ & ECON. 297, 326 (1978); Steven Tadelis \\ & Oliver Williamson, \textit{Transaction-Cost Economics}, in \textit{The Handbook of Organizational Economics} (Robert Gibbons \\ & John Roberts eds., 2013).} If the fiduciary expects this, then she will have significantly dampened incentives to perform the specialized tasks and invest in firm specific knowledge vis a vis what is optimal. As a result, both the corporation and its fiduciaries stand to benefit from an enforceable contract for allocating corporate opportunities among them in advance. Nonetheless, it is worth noting that the hold-up problem can obviously run both ways – fiduciaries may hold up the corporation, just as it may hold-up its fiduciaries. There seems to be no \textit{a priori} reason to view one party to be more opportunistic than the other,\footnote{There are some instances in which opportunism by the corporation is significantly more likely. Consider a joint venture ("JV") entity formed by two major rival corporations for a narrow and specific collaborative purpose. Typically, both of those rivals will owe the JV fiduciary duties. \textit{See Sarath Sanga, The Corporate Joint Venture: A Contractual Solution to Fiduciary Conflicts} (Working Paper) (discussing fiduciary duties owed by members of corporate joint venture). In this circumstance, there may be far more scope for the entity to be weaponized by one corporation and used to hold-up its rival (via fiduciary duty claims), than for the rivals to hold up the JV.} but the prospect of subsequent hold-up by the firm can be a significant driver for an \textit{ex ante} waiver.

2. \textit{Board Dynamics}

Advance commitments can carry a host of other benefits as well. From a psychological vantage point, the members of a board may find it easier to commit to relinquish prospective business opportunities upfront, in say a charter or contract provision, than in a later ad hoc process when the opportunity is directly presented and the loss of prospective profits is palpable.

Depending on when the adoption of an \textit{ex ante} waiver occurs, it can also allow a board to avoid a conflicted vote, and potentially, to be insulated from any possible breach of duty of loyalty allegation. For instance, if a COW is adopted in a firm’s IPO charter, then a prospective corporate fiduciary can bargain with the corporation at arm’s length and the pre-IPO board can hold a vote on whether to include the COW without any member needing to recuse herself.

3. \textit{Liquidity constraints}

Another potential driver of advance waiver activity is the influence of liquidity constraints, either at the firm or the fiduciary level. In conventional economic frameworks, agents (the fiduciary) are wealth and capital constrained, and thus unable to “pre-pay” for the non-monetary contractual rights that they value most highly. When such rights consist of the allocation of corporate opportunities, the parties may be unable to reach an agreement allocating those projects to the fiduciary even when the fiduciary is the most efficient producer. In this case, of course, the default rule (reserving rights for
the corporation) may well be optimal, and thus there would be little need for an \textit{ex ante} waiver.\footnote{This point is developed more fully in Talley, \textit{supra} note 39, at 357-60.}

In other instances, however—particularly involving startups—the \textit{corporation} is the party that is cash poor and capital constrained, hindering its endeavors to attract managers, directors, and potential investors. Although the entrepreneur could offer to remunerate these actors with equity, doing so has a dilutive effect on founders, common shareholders, and employees—an effect that can erode internal incentives to maximize value. One possible alternative in such situations is to offer in-kind modes of compensation, including the allocation of property rights over future business opportunities. Symmetric to the discussion above, in-kind compensation of this sort may efficiently require the corporation to waive rights on certain projects where it is marginally the more efficient producer, thereby providing the fiduciary a platform from which to profit from the new opportunity itself (or alternatively to resell it to the corporation at a less capital constrained juncture). In this case, executing a seemingly broad waiver may still create value for shareholders if it is combined with attracting significant managerial talent.

4. \textit{Rules versus Standards}

\textit{Ex ante} waivers may also offer distinct benefits because they authorize private parties, through contract, to replace the immensely complex and nebulous \textit{standard} of the common law with a \textit{rule} crafted by the parties themselves (or at least a more refined standard).\footnote{See Louis Kaplow, \textit{Rules Versus Standards: An Economic Analysis}, 42 DUKE L. J. 557 (1992) (offering a canonical economic exposition of the rule-standard distinction).} Even if the parties would ultimately end up with the same allocation of corporate opportunities \textit{ex post} as \textit{ex ante}, the ability to substantially clarify that allocation through advance contracting can substantially reduce the scope for litigation costs stemming from either opportunism or honest mistake. To be sure, few contractual provisions define perfectly clear boundaries, and the COWs we observe do not even attempt to do so. Nonetheless, COWs generally replace a \textit{highly indefinite standard} in one of fiduciary law’s most convoluted areas with significantly better defined directives (and sometimes with very well-specified ones). This may be able to deliver substantial cost savings which can be divided by the parties.

In addition, the clarity of advance waivers can help establish clear ground rules that serve as the backbone for a long-term commercial relationship. Consider, for example, the 2007 COW disclosed by NetSuite Inc. (“NetSuite”), related to its significant block shareholder and board member Lawrence Ellison. As a condition to his involvement with the company, Mr. Ellison demanded a broad COW from NetSuite, which NetSuite’s board of directors approved and disclosed in SEC filings.\footnote{NetSuite Inc. 10-K filed Mar 13, 2009.} After describing the common law standard, NetSuite replaced it with a \textit{bright-line rule}: “[A]s a majority stockholder, Mr. Ellison might, in certain circumstances, have had a duty to present to the corporation matters that come to him that are within our line of business or would be deemed of interest to us. Under the waiver, we have renounced any such duty, and \textit{Mr. Ellison will not need to present any such opportunities to us.”\footnote{\textit{Id.} (emphasis added).}
Although this waiver is clearly quite broad, it may also have been necessary to bring on Ellison as a significant investor. More importantly, this waiver plausibly helped pave the way for a long term relationship between Ellison, Oracle, and NetSuite, one that arguably facilitated Oracle’s recently announced $9.3 billion acquisition of NetSuite.\(^{107}\)

As noted earlier, the discussion above is meant to demonstrate only that there exist several plausible economic contexts where corporate opportunity waivers—even broad ones—are value enhancing for both the beneficiary and the waiving corporation. Such contexts, of course, must uneasily co-exist with omnipresent agency cost problems, in which corporate fiduciaries may use their influence at the company to line their own pockets at shareholders’ expense. To the extent that the former efficiency-related factors outweigh agency cost considerations, Delaware’s reform program has been beneficial for capital investors. To the extent the opposite holds, however, the policy landscape flips. Ultimately, this question is indeterminate within the realm of economic theory alone, and an empirical analysis is warranted. It is to that analysis that we now turn.

### III. EMPIRICAL ANALYSIS

The historically unprecedented power that many corporations now have to opt out of the corporate opportunities doctrine seems to have been largely overlooked in both case law and law and finance scholarship, generating little systematic analysis in any form.\(^{108}\) This neglect is surprising, and it seems undeserved for several reasons, ranging from the technical to the policy related.

On the more technical side, the duty of loyalty is a long-hallowed “sacred cow” of fiduciary principles, traditionally unyielding to private, contractual end-runs. Any systematic shift that concerns when and how corporate entities may embrace such waivers is, at the very least, important to document, given its departure with longstanding legal tradition. Second, a cottage industry of corporate governance metrics for incorporated entities has taken root in the last decade.\(^{109}\) These metrics seek to aggregate and assess when firms opt out of (or otherwise contract around) various corporate law default rules, such as through classified boards, poison pills, duty of care waivers, blank-check stock, and the like. The results can be useful for both scholars and industry groups, such as proxy firms that often address corporate governance votes for institutional clients. Sophisticated producers and consumers of such metrics should be interested in these new mechanisms that permit parties to contract out of the duty of loyalty in order to provide a complete picture of governance arrangements.

More substantively, corporate opportunity waivers bear on central “big picture” debates in corporate law. First, how corporations respond to this new power to tailor can

importantly inform scholarly debates regarding whether corporations actually use their capacious legal freedoms to tailor default terms. The question lurking in the background—and one of corporate law’s most profound quandaries—is whether we can expect (or trust) corporations, when freed to do so by law, to adopt optimal corporate governance structures on their own accord.

Even more generally, the empirical experience of COWs goes straight to the heart of the principal normative question: Are COWs socially beneficial? This question arises at the intersection of two distinct, but important strains in corporate theory: For the very transaction-cost arguments that motivated the amendments permitting COWs are in significant tension with well-known arguments justifying loyalty as a core check on managerial opportunism and agency costs. Understanding how corporate opportunity waivers have played out in the post-deregulatory environment (and why) may shed light on other areas where scholars vigorously disagree as to whether fiduciary duties should be mandatory.

The scant literature on COWs may be—at least in part—an artifact of the practical difficulty of data collection. Most conventional corporate governance provisions are located in relatively discrete and easy-to-isolate sources (such as the charter or shareholder-approved bylaws). As documented above, however, COWs are generally not required to be executed according to any particular regimen, and thus they may be scattered across myriad corporate documents, including charters, bylaws, contracts, board resolutions, and the like. Consequently, searching for waivers requires combing through many (if not all) disclosures made by public companies to securities regulators.

In this section, we describe and report on an empirical analysis of a large sample of COWs disclosed in public corporate filings, which we extracted and coded. We find that corporate opportunity waivers are common and widespread among public companies within our sample. Moreover, we employ machine learning techniques to extrapolate our classification procedure outside of our sample, from which we can infer (with significant confidence) that over fifteen hundred public companies to date have made use of their new-found freedom to contractually allocate corporate opportunities, and they continue to do so at an increasing rate. Waivers appear across industrial sectors, although they are overrepresented in industries like private equity and oil and gas.

In addition, we also employ in this section a variety of empirical methods to examine the normative question of whether corporations have used the freedom to adopt corporate opportunity waivers to create or destroy value. First, we find that the companies embracing COWs tend not to generally exhibit indicia of questionable investment value or managerial practices. Rather, using standard measures of firm value, they appear to have markers of value creation and effective management. We also conduct an event study as a measure of the value created by adopting a corporate opportunity waiver, using the stock market’s reaction to their public disclosure as a

---

110 See Henry Hansmann, Corporation and Contract, 8 AM. L. & ECON. REV. 1, 1 (2006) (“[p]ublicly traded corporations rarely use the nearly absolute freedom afforded them to . . . deviate from the default terms of state corporation law.”).

112 See supra note 47 and accompanying text.
proxy. Perhaps surprisingly, for those firms where we are able to measure returns on stock-price reaction to an announced COW, the market appears to receive such news positively, generating 4-day cumulative abnormal returns of between 1% and 1.5%. In addition, as a robustness check, we make use of the lagged implementation of reforms across the nine reforming states. We similarly find evidence of a positive market response to passage of a COW reform among issuers incorporated inside the reforming jurisdiction. These findings go some way to support the value-creation rationale behind waivers – at least overall – and to allay fears that corporations adopting COWs are systematically those with worse agency costs.

A. Data

To investigate the empirical incidence (and effects) of COW adoption, we constructed an original data set based on disclosures by publicly traded corporations. Typically, if a public company adopts a waiver of corporate opportunities, the adoption is likely to be disclosed in some form of document that the corporation will file with the U.S.’s principal financial regulator, the Securities and Exchange Commission (“SEC”), on the SEC’s EDGAR website. We began by utilizing a “mirror” of EDGAR, which replicates over 21 million issuer filings available from 1995 through March 2016.113 Because most states’ statutes authorizing COWs permit their execution across a wide spectrum of contracts, resolutions and corporate governance documents, we did not constrain our examination of EDGAR filings to any specific filing “form” (such as 10Ks, 8Ks or 14As). To this mirrored data set we applied a Boolean key-word search114 – similar to what one might use in a WestLaw or LexisNexis query – designed to identify candidate instances of a disclosed COW based on a filing’s similarity with the search query.115 This process resulted in 10,682 distinct candidate disclosures. Our key-word search was designed to be quite general, but in so doing we also assured that it was relatively over-inclusive.

From this large candidate data set, we randomly selected one thousand excerpts to be coded manually, by ourselves and a small group of trained research assistants. We designed a coding procedure that employed forty-one distinct variables.116 Our rubric focused on the three fundamental questions that pertain to any waiver:

1. How is a company adopting the waiver? The first seven variables inquire as to how a filing company is adopting a COW, whether in its charter, bylaws, board resolution, or some other kind of disclosure.

---

113 See generally U.S. Securities and Exchange Commission, EDGAR, Company Filings, https://www.sec.gov/edgar/searchedgar/companysearch.html (noting “access to more than 21 million filings”). 1995 was the first year for which the database has reliably global coverage.

114 The exact search took the form: “[((corporate OR commercial OR business) followed by (opportunit!)) within the same sentence as [(waiv! OR renounc! OR disclaim)!]]”. The “!” marks here serve as root expanders to pick up any stems, alternative endings, or punctuation marks around the relevant word.

115 For every matching candidate document, we extracted the responsive sentence (or sentences) as well as three preceding sentences and three succeeding sentences around each detected excerpt (or “snippet”).

116 The coding rubric is available from the authors. We engaged in a significant training and cross-validation program with the research assistants who coded excerpts, designing significant “overlap” in coded terms, so as to detect (and correct) inter-coder inconsistencies.
2. **Who** is covered by the waiver (e.g., a single officer/director, all officers/directors, a controlling shareholder, and so forth)? The next thirty variables inquire into who is covered by the COW. This sequence includes both who is covered at the filing entity (14), and, if another entity is mentioned, then who is covered within the management / ownership structure of that other entity (16).

3. **What is the extent** to which a company is waiving the corporate opportunities doctrine as to those covered? The last four variables inquire into whether the scope of the waiver covers all business opportunities, a specified list of such opportunities, all opportunities except for some specified subclass; or a wildcard term waiving corporate opportunities “to the fullest extent allowed by law” (or a substantive semantic equivalent).

As noted above, the key-word search we used to identify candidate COWs was deliberately over-inclusive, flagging a series of documents that were sure to include some “false positives” – snippets that satisfied the key-word criterion but were judged by coders not to reflect COWs.

After cleaning the hand-coded sample data, we deployed several measures to enhance the richness and reliability of the data. First, we linked our database to a variety of other publicly available datasets that are widely used in law and finance scholarship (Compustat and CRSP) to gain insight about the financial and governance characteristics of issuers adopting COWs. Second, we used the hand-coded data to train a machine learning (ML) classifier, adapting a technique previously developed by one of us to code the remainder of the snippets algorithmically.\(^{117}\) This process not only enabled us to look beyond our sample of COW disclosures with significant confidence,\(^{118}\) but it also facilitated an additional audit of the hand-coded data for errors or inconsistencies.\(^{119}\)

**B. Descriptive Statistics of Waivers**

Within the randomly selected sample of 1,000 candidate SEC filings, our manual coding enterprise yielded 628 responsive documents from 427 unique issuers that contained a bona fide COW disclosure. Of these, 237 were operative provisions in which a filing company enacted a COW, and 391 were disclosures discussing such an operative provision elsewhere. (The remaining candidate documents were deemed non-responsive—reflecting a 38.5% “false positive” rate from our key-word search.) Extrapolating proportionally to the full population of 10,682 filings, one would predict upwards of 6,700 responsive disclosures across the population of snippets. And indeed, the ML-classifier bears this prediction out, detecting 6,859 COW disclosures from 1,592

---

\(^{118}\) The ML classifier proved extremely accurate, correctly categorizing COWs 93.5% of the time within our hand-coded sample. The classifier lost little of its mojo even when extended *outside* the sample: in Monte Carlo simulations, it correctly categorized simulated out-of-sample COWs at a mean rate of 92.5% (with standard deviation of 1.50%). For details, see Rauterberg & Talley, *supra* note 9.

\(^{119}\) We inspected all snippets where the human-coded and machine-classified data disagreed as to the presence of a COW (n=65). In around 80% of these cases, we concurred with the humans. We re-coded the remaining 20% where we agreed with the machine, and then we completely re-trained the ML classifier.
unique issuers (averaging around 326 disclosures per year over two decades). These figures alone embody a key finding of this study: Public companies have shown a significant appetite for contracting out of the fiduciary duty of loyalty.

That appetite, however, was slow to arrive. Figure 3 illustrates the yearly counts of COW disclosures in both our hand-coded sample (left axis; blue line) and in the ML-classified population (right axis; red line). Note that the incidence of disclosed COWs was initially quite low—though not zero—both before and immediately after Delaware’s statutory amendment in 2000. The non-zero incidence of disclosed COWs prior to 2000 is not altogether surprising, given that DGCL § 122(17) was itself a legislative rejoinder to a judicial response to a disclosed waiver. The initial reticence of issuers to embrace the COW from 2000-3, in contrast, is somewhat more notable; and it attracted the attention of commentators at the time. It is plausible that this initial tepid response reflected the post-dot com hangover that suppressed U.S. financial markets. Whatever the reason, by 2004 the herd of COWs began to propagate with impunity, growing roughly exponentially since (with a slight buckle during the financial crisis). By the turn of the decade, COW disclosures had become commonplace—surpassing 1,000 per year by 2014. (Counts for the complete 2016 year are not available as of this writing.) There is significant heterogeneity in the forms of disclosure, reflecting the open-ended waiver procedure authorized by most states’ enabling statutes. Just under half of the COW disclosures come from IPO-related filings; approximately ten percent appear in each of “current report” (8-K) filings and routine annual / quarterly filings (10-K or 10-Q); and around seven percent appear in proxy materials. (These figures are nearly identical in both the hand- and machine-coded data.)

Figure 3: Total COW Disclosures by Year (Hand-Coded v. ML-Classified)

120 While the ML classifier tags between 10 and 11 times as many COW disclosures as the sample (as expected), it identifies only between 3 and 4 times as many unique issuers. This is also unsurprising on reflection: as sample size grows, it becomes increasingly likely that multiple disclosures by single issuers are picked up.

121 See Austin & Gottleib, supra note 7.
Another important issue surrounding COWs is where they can be found within firms’ governance documents and other written instruments. Table 2 summarizes the location of manually coded waivers across various document types:

<table>
<thead>
<tr>

Table 2: Location of COW in Corporate Governance Documents

Note from the Table that over three quarters of the COWs in the sample appear to be located in a corporate charter, evincing a degree of commitment to the waiver that is difficult to unwind absent a shareholder vote. That said, nearly one in five waivers appear to be spread across a variety of contractual instruments, which are usually – in contrast – susceptible to renegotiation and restructuring by the board alone, without shareholder involvement.

As noted above, the wording of most states’ statutes provides appreciable freedom for the drafters to waive broad or narrow categories of corporate opportunities. Given that the default rule in corporate law is no waiver, a broader express waiver signals a greater departure from traditional fiduciary principles. Table 3 summarizes the scope of COWs in the sample. The breadth of the language in the waivers is notable. Just over forty percent of COW disclosures include at least one waiver that purports to waive “all” corporate opportunities. Over half include at least one waiver purporting to waive “all but” a reserved class or category of opportunities. Nearly three in five disclosures waive the doctrine to “fullest extent” of what the law permits. In our estimation, these clearly represent notably broad waivers. In contrast, only about twenty percent of COW disclosures waive the doctrine in a more modest fashion, limiting the disclaimer to a specified class or category of opportunities.

Table 3: Scope of Waiver

Another important scope consideration is how the coded sample allocates waivers across different types of corporate actors. Recall that this group can include corporate

---

122 Tables 2-4 concentrate on our hand-coded sample, leaving for another day the calibration of a machine-learning classifier for these nested subsidiary provisions. Note that total counts of provisions tend to exceed the aggregate number of COW disclosures, since the sub-categories are not mutually exclusive. Percentages are based on the “Operative Provision” categories.
directors, officers and dominant shareholders, all of whom owe a loyalty obligation to the corporation. Table 4 summarizes the target of the coded provisions by the role of the actor. (The aggregate counts listed significantly exceed the total number of detected waivers, since waivers routinely apply to multiple classes of actors, and sometimes differentiate between sub-classes of actors.) Corporate directors are the most frequent beneficiaries of COWs, covered by nearly three-quarters of COWs in our sample—an observation consistent with the aim of the reform (described above) to ameliorate conflicts that come from overlapping directorships among venture capital and private equity investors. Perhaps for similar reasons, shareholders are commonly beneficiaries of a waiver as well, covered just under 40 percent of the time. Notably, however, corporate officers are also routinely included in COW disclosures, with a waiver applying to them nearly half of the time.

Table 4: Corporate Fiduciaries Covered by COW

C. Issuer Characteristics of COW Adopters

The exercise of harvesting, coding, and documenting COW disclosures is one of the key contributions of this article. Nevertheless, it is possible to say somewhat more by linking the disclosing issuers to several other databases providing industry and financial data. A particularly interesting industry source is the Compustat database, which constitutes the predominant source of information related to corporate governance and financial performance as disclosed in issuers’ annual and quarterly financial reports. We therefore undertook to link the COW database to Compustat (for the period 1994-2016). Although this matching process resulted (as it often does) in some loss of data, we were able to match a significant fraction of COW disclosers with their financial information: we ultimately matched approximately 363 issuers in the hand-coded data sample and 1,695 issuers in machine-classified population.\(^{123}\)

Using these matched firms, it is possible to consider a host of firm-level indicia. Preliminary analysis suggests the industry representation of disclosed COWs appears to track that of Compustat firms, with a few notable areas of industry overrepresentation. In particular, Oil and Gas issuers represent 9.71% of COWs as compared with 3.95% of Compustat firms. Similarly, Business Services issuers represent 13.12% of the pilot sample, but only 9.04% of the Compustat universe. The over-representation in both

\(^{123}\) Since reliable financial filings occur on an annual basis, the merged data are best analyzed with an “issuer-year” unit of analysis, so that any issuer making multiple COW announcements in a single year would be collapsed into a single observation for that year. This process resulted in collapsing just over 90 of the COW disclosures in the hand-coded sample and around 3,300 in the ML-classified population.
industries plausibly reflects the popularity in these industries of ownership structures characterized by multiple investments across portfolio companies. (Additional research and data collection will be needed to test this hypothesis.)

Because corporate law (and the permissibility of COWs) is an artifact of state law, adopters’ incorporation jurisdiction is of obvious interest. Perhaps not surprisingly, the public firms embracing COWs are heavily overrepresented by Delaware. Indeed, as Table 5 illustrates, in both the hand-coded and machine-classified data sets, fully nine out of ten waiver disclosures come from Delaware corporations, far more than the population-wide proportion of U.S. public companies incorporated in Delaware (which is just north of fifty percent).

Table 5: COWs in Sample, by State of Incorporation

The significant overrepresentation of Delaware may be due to a variety of factors, including the fact that Delaware was the earliest mover, the significant network externalities among the Delaware bench and bar, the (possibly) larger comparative size of Delaware incorporated adopters, and the potential remaining invalidity of COWs in many other states.

One benefit of linking the data on disclosed COWs to other financial databases is that doing so sheds considerable light on both what types of companies embrace waivers and what such adoptions portend for company value. Our empirical analysis provides several interesting insights about the relationship of COW adoption and financial measures related to profitability and value creation. Some of these relationships are reflected in Tables 6a and 6b. As Table 6a illustrates, COW adopters tend to be smaller on average—not larger—than the mean Compustat issuer on many balance sheet metrics, such as total assets, total liabilities, and long-term debt. Yet the median COW adopter, in contrast, tends to be somewhat larger than the population median, suggesting that COWs are embraced by a narrower cross-section of issuers that are relatively large, but not at the highest (or lowest) end of the distribution. In addition, disclosing firms appear to exhibit substantially stronger median income-statement metrics, revenues, capital expenditures and earnings, with roughly commensurate means. COW disclosers also appear to have stronger market appeal than the Compustat comparators. One frequently-used measuring stick of value creation within finance is the annual return that the issuer makes on its overall assets (ROA)—a valuation metric that is largely independent of debt/equity structures. Here, COW disclosers within the two samples tend to outperform the comparator Compustat group (along both mean and median dimensions) in generating
returns for outside capital investors. Table 6b reports the same set of valuation metrics but with both samples limited to Delaware incorporated firms. Most of the patterns persist here too (with some variations).

</table>

The descriptive statistics summarized above paint a picture that holds clear relevance to larger policy debates explored above about COWs specifically, as well as the contractibility of fiduciary duties more generally. In particular, we see no evidence – based on these data – that COWs are systematically embraced by under-achieving firms that use the waiver as a pretext for inefficiently diverting value away from capital investors. To the contrary, these data suggest that waivers are adopted by relative healthy companies, with robust cash flow potential and an established record of delivering attractive returns to their capital investors. This profile is consistent with the shareholder-value enhancing account of COWs developed above,\(^{124}\) in which they can serve as important complements to building value-enhancing corporate structures by clarifying the boundaries of what is sometimes considered an incurably opaque and recondite area of corporate fiduciary law.

**D. Market Reaction to COW Adoptions**

The results discussed above are based on summary observational data, and are thus ill-suited to supporting strong causal inferences about the welfare effects of COW adoption.\(^{125}\) Many alternative stories could explain the same relationships. For example, it may simply be easier for opportunistic managers to adopt COWs in healthy companies because shareholders might scrutinize board action less. That said, our study’s focus on publicly traded companies permits us to use alternative approaches to develop some insight into causal relationships. One such approach is to examine the extent to which COWs contribute to (or detract from) firm value by measuring the reaction of the capital markets. To the extent that stock prices of public companies tend, on average, to reflect

\(^{124}\) See Section II, supra.

\(^{125}\) Indeed, this is a well-known limitation endemic to much of empirical corporate finance, which frequently marshals observational data.
publicly available information,¹²⁶ one instructive means for assessing COWs is to consider how market prices react to the first public disclosure an issuer makes about the existence of (or plans for) a waiver. Our data set is amenable to such an inquiry: indeed, we are able to identify the first disclosure date with all of Compustat-matched firms reported in the previous subsection, which in turn allows us to match these firms to their securities market prices as reported in the CRSP database. We measure market reaction to the disclosure of news using the familiar event study approach.¹²⁷

In order to implement an event study analysis with sample data, we matched the first available disclosure date for each unique COW with securities marked pricing data for each disclosing issuer. (This matching process led to the loss of approximately 100 observations from the 363 Compustat matched firms). To estimate reliably the parameters ($\alpha_i$ and $\beta_i$) for each of the remaining stocks using the underlying asset-pricing model, we additionally required each matched issuer to have at least 35 days of trading at least one month prior to the disclosed COW. This criterion—while consistent with standard practices—imposed a significant data limitation: Because many COWs are disclosed as part of either new or newly spun-off companies, many of our COW-disclosing issuers had insufficient trading days preceding the disclosure. In the end, we were able to identify 83 COW distinct issuers that had sufficient pre-disclosure pricing information to perform an event study.

![Graph](image)

**Figure 5:** Mean Cumulative Abnormal Return of COW Disclosers (solid line) and 95% Confidence Interval (dashed line)

¹²⁶ This is the most popular articulation of the phenomenon sometimes referred to as the semi-strong form of the “efficient capital market hypothesis” or ECMH. Although the ECMH has drawn some critics over the years, most economists tend to continue to subscribe to its general precepts. See Steven L. Jones & Jeffry M. Netter, *Efficient Capital Markets, in Concise Encyclopedia of Economics* (David R. Henderson 2d ed. 2008). The United States Supreme Court has recently reaffirmed its own general acceptance of the ECMH in the context of securities market litigation. See Halliburton Co. v. Erica P. John Fund, Inc., 573 U.S. __ (2014).

¹²⁷ An important feature of a securities market event study is a designated methodology for predicting the “expected return” of the stock. This step is conventionally accomplished by adverting to an asset-pricing model in finance – which predicts a stock’s return as a function of overall market conditions. Many alternative asset-pricing model variations exist within the literature, but perhaps the most prominent of them is the “Capital Asset Pricing Model” (CAPM). See generally Ivo Welch, *Corporate Finance* (3d ed. 2014), Ch. 9. In what follows, we deploy the CAPM as a baseline, but we check the robustness of our results against a variety of alternative pricing models.
We considered three different event windows, each beginning one-day prior to the recorded date of the COW disclosure (to allow for some pre-disclosure leaks), and ending either 1, 2 or 3 days post-disclosure. Figure 5 graphs the mean cumulative abnormal returns of the disclosing issuers (pictured with the solid line), and the 95-percent confidence interval around that mean (pictured with the two dotted lines above and below). For all event windows chosen, COW disclosures predict a positive market reaction, with cumulative abnormal returns hovering between 0.5% and 1.3%. The noise associated with these estimates is nontrivial, but for the 4- and 5-day event windows, the effect is borderline statistically significant at the standard 95 percent confidence level (two-tailed test).

Figure 5 suggests a statistically weak—but economically significant—positive market reception to the disclosure of a COW. We interrogated the robustness of this result in two ways. First, we varied the nature of the underlying asset-pricing model, introducing (1) a simpler market-adjusted abnormal return measure (the equivalent of setting $b=1$ for all firms); (2) a three-factor model, combining the equity risk premium from CAPM with premia on a large versus small portfolio and high book to market versus low book to market portfolio; and (3) a four-factor model that additionally introduces a momentum factor. Table 7 reproduces the results. As with Figure 5, abnormal returns continue to be estimated with appreciable noise, and many of the estimated effects are statistically insignificant at conventional thresholds. Nevertheless, none of the estimation approaches yield negative abnormal returns for the announcement of a waiver, and for many specifications the average CAR was economically significant—hovering around one percent. Note further that the 4-day event window spanning days (-1,+2) persistently yields the CAR estimates with the largest magnitudes, and it is either statistically significant or somewhat close to significant in all cases. This is consistent with the news of a COW disclosure taking some time to penetrate the market. However, the weakening of this effect in the (-1,+3) window—a weakening that largely flattens out for longer event windows—suggests that some of the initial average response dampens. We view these results as weak evidence that the adoption of a COW does not appear to predict loss of market value: if anything, the opposite is true.

Even if a COW disclosure predicts a mild positive market response, however, it does not follow that this response is visited evenly on all types of firms. As noted in the previous subsections, issuers within our sample differ along a variety of dimensions, including incorporation jurisdiction, size, and the type and nature of the waiver at issue. For some types of firms, or some types of waivers, the market response is negative. Although our event study sample is limited in size, it allows us to push on some of these issues further.

Table 8 reports on the CARs associated with a CAPM model and an event window of (-1,+2) for a variety of groupings of the data: Delaware versus non-Delaware incorporation, location of the waiver, who is covered by the waiver, breadth of the waiver, and the size of the issuer (as measured by assets). Note that the Delaware incorporated firms appear to enjoy uniquely positive market reception of their COWs, with a CAR of 1.45% that is strongly significant. Non-Delaware issuers, in contrast, experience a very mild (and statistically insignificant) upward abnormal return of approximately 30 basis points. Somewhat surprisingly, locating a waiver in a charter

---

129 Italicized figures are t-statistics. *** denotes statistical significance at the p=0.01 level; ** denotes statistical significance at the p=0.05 level; * denotes statistical significance at the p=0.10 level. For the table, CAPM is used as the baseline asset-pricing model with event window of (-1,+2) around first COW disclosure. A “Broad” provision specifies either “All” COs are waived, or COs are waived “To the Fullest Extent Allowed” by law. Issuers are considered “large” if they have total assets in excess of $1 billion, and are “small” otherwise.
amendment provision (where it is voted on and/or potentially priced by shareholders) does not seem to improve market reception. To the contrary, COWs executed outside of the charter seem to be met with an especially positive mean abnormal return. A particularly interesting aspect of Table 8 concerns how and whether coverage of a corporate officer or dominant shareholder interacts with market reception. One might — on first principles — be especially skeptical about waivers that protect officers and corporate shareholders, since those are the constituencies who are most susceptible to problematic conflicts of interest. Table 8, however, suggests that if anything, market reception to such provisions cuts in the other direction, and COWs that cover officers and/or shareholders meet with appreciable approbation in capital markets.

Note as well from Table 8 that the breadth of the provision does not appear to explain much in predicting market response. However, firm size does: Smaller firms (those with under $1 billion in assets) tend to benefit the most from corporate opportunity waivers. Indeed, they benefit to a significant degree — with a 4-day CAR of nearly 2.4 percent. Such firms are more likely to be in more streamlined entrepreneurial environments, drawing on the expertise of many corporate fiduciaries who have many prospective conflicts as the firm grows. Large established firms, in contrast, are more likely to have significant scope of operations, and they need not work as hard to attract managerial talent.

A legitimate concern to analyzing the first disclosure of a COW is the “bundled” nature of the disclosure. As detailed earlier, the vast majority of waiver disclosures are made alongside many other disclosures (such as in a 10-K / 10-Q or a public-offering-related filing). And even when the COW disclosure is made in a more sui generis filing (such as an 8-K), the disclosure tends to accompany other news (such as an announced restructuring, or significant investor, or equity carve out, etc.). One could argue that such information bundling represents a prohibitive statistical confound, which could easily lead to a spurious misattribution of any observed abnormal returns.

While we are in some ways sympathetic to this critique, it is not entirely clear what the appropriate response should be in the specific context of COWs. As detailed in Part II, the principal impetus behind the reform movement led by Delaware was the argument that corporate opportunity waivers are a critical ingredient of value-enhancing corporate structures and transactions—the same ones to which COWs are now routinely attached. In other words, advocates of the reform made a strong (and ultimately convincing) argument that many types of innovative investment and financing structures would not be possible without the availability of a waiver. To the extent this account is plausible, a COW constitutes a “but-for” cause of the transaction accompanying it. The bundled nature of waiver disclosures, then, is less of a bug than a feature—a manifestation of the very economic benefits COWs were designed to unleash.

That said, one alternative lens through which to analyze the extent to which COWs contribute to shareholder value is by exploiting the fact that since Delaware’s reform in 2000, eight additional states have adopted statutes permitting corporate opportunity waivers. From any given incorporated company’s perspective, the timing of such reforms is plausibly exogenous. As a robustness check, then, we investigated the market response to the passage of COW-enabling statutes across each of the nine states detailed in Table 1. To mark the relevant “event date” in each state, we concentrated not on the statute’s effective date (as detailed in Table 1), but rather on the date on which any
remaining uncertainty about enactment’s inevitability was resolved: The date the state’s governor signed the legislative bill. The signing date is also frequently a newsworthy event (and was covered by press releases in each enacting state), helping ensure that it was generally known among the relevant investor communities. Around this event date, we made a similar inquiry as above, pertaining to whether there was a measurable abnormal return in and around the signing date among issuers incorporated in the reforming state. A graphical representation of the results appears in Figure 6:

![Figure 6: Mean Cumulative Abnormal Return Around Bill Signing Date for Firms Incorporated in State (solid line) and 95% Confidence Interval (dashed line)](image)

As can be seen in the figure, market responses in the days immediately surrounding the various signing dates appear once again to be positive, hovering somewhere in the 0.4% to 0.7% range up to a week out. Not surprisingly, the economic magnitude of the detected effect is more modest than in the case of COW disclosures, since the enabling bill’s enactment merely gives issuers the real option of adopting a waiver at a later date (presumably as part of a larger financial transaction or restructuring). It is also worth noting that the positive CARs observed in the first week following signing dissipate (and effectively disappear) for longer periods. Nevertheless, it is still a fair conclusion from this preliminary assessment that if anything, securities markets reacted mildly favorably to the enabling act’s execution in those states embracing reform.

IV. IMPLICATIONS

The foregoing analysis is no doubt just the tip of the iceberg when it comes to understanding the incidence, drivers, and effects of corporate opportunity waivers. Indeed, a key impetus behind this project was our (and others’) desire to understand more about the results of the statutory experiment started over a decade and a half ago in the Delaware State Legislature. The data set we have developed here will not only inform future academics and researchers, but it may provide helpful feedback to those interested in shaping and fine-tuning the substance of fiduciary law in the future. That said, our

---

130 In the interests of full disclosure, we considered two alternative focal events: the introduction of the enabling bill, and the date of its passage in the last legislative house before gubernatorial execution. In both cases, cumulative abnormal returns tended to fluctuate around zero (and were statistically insignificant).
analysis of COWs within public companies affords us a few potential policy insights. We explore four of them below.

A. Evaluating COWs

Many outside observers and investors would plausibly react with alarm when reading a broadly worded corporate opportunity waiver such as the following: “BE IT RESOLVED: That the Company waives Mr. Ellison’s obligation to present Corporate Opportunities to the Company.” The breadth of such a provision immediately conjures up images of a thicket of dysfunctional agency costs traditionally believed to plague the diffuse ownership structures of public corporations. Indeed, we initially shared this same instinct. However, our empirical and conceptual analysis suggests that such fears may actually be mistaken—or at least overblown.

From a purely descriptive perspective, based on the evidence analyzed above, it appears that COW adoptions tend not to reflect an opportunistic free-for-all among corporate fiduciaries. We find little evidence, for example, that COWs are typically embraced by underperforming firms, where opportunism and agency costs are rife. Adopting firms appear instead to be moderate in size, with appreciable growth potential, robust revenue patterns, and relatively strong market returns.

An event study analysis, which is better situated to account for causal inference, suggests a similar conclusion: securities markets generally appear to welcome the disclosure of COWs, generating weak positive abnormal returns on announcement. This positive response appears concentrated in moderately sized firms and in Delaware corporations. The underlying scope, breadth, and location of a COW may well matter, but it does not appear to be as critical a statistical factor as some might have thought. Indeed, if anything, the results tend to cut against plausible concerns about specific types of waivers. For instance, waivers covering officers and/or dominant shareholders, or those which are conspicuously broad (such as Mr. Ellison’s), could reasonably have been expected to be the most value destroying. The market reaction though suggests that investors sometimes expect the opposite of such disclosures.

B. Contractualizing the Duty of Loyalty?

One obvious question raised by Delaware’s statutory experiment is whether it has any implications for debates about contractualizing the duty of loyalty in general, and rendering corporate law’s few mandatory rules, defaults. Even if the normative picture is muddy, for instance, a reader might be tempted to infer based on our findings that corporations would have a similar appetite for contractual tailoring in other duty of loyalty contexts as they have shown with respect to the corporate opportunities doctrine.

We would suggest two reasons for caution here, however. First, the legal terrain of the duty of loyalty is varied, and its dimensions differ in important ways. For instance, the COD may simply be much more complex, indeterminate, and prone to litigation than other forms of conduct proscribed by the duty of loyalty, such as self-interested transactions between fiduciaries and the corporation. If this is the case, then opting out of

---

the COD might have proved popular, but the same firms might not show similar interest in waiving other aspects of loyalty.

Second, and relatedly, if one of the principal reasons firms contract out of the COD is due to the litigation risks the doctrine generates, then an alternative explanation for the prevalence of COWs would be their function in reducing the likelihood of litigation, rather than the potential corporate governance benefits discussed above. Both of these caveats provide interesting avenues for future research that we must leave for another day. Until they are answered, caution must be exercised in generalizing from § 122(17) to other areas of the duty of loyalty.

C. Who Should Design Corporate Law and Governance?

If the master problem of corporate law is designing optimal governance arrangements to resolve the principal-agent problem, then one of the great “meta” questions in the background is precisely who should determine those arrangements and when. A thicket of descriptive and normative issues are implicated here, including the quality of the governance structures offered by law and regulation; whether, when those structures are defaults, corporations tailor their governance around them and whether that governance is superior; and as a result, who should be empowered by law to have the last word on crucial governance issues, such as the very loyalty of senior management.

These questions are too fundamental to be answered by any single study or legal issue. Nonetheless, the corporate response to statutory enactments liberalizing COWs – and the securities market response to that corporate response – have fascinating implications for these debates. At least as regards the duty of loyalty, one descriptive fact seems unassailable – when freed to do so, a wide range of corporations eagerly embrace the power to contract out of aspects of the duty of loyalty. Further, such actions tend to meet with a generally positive market response (or at least do not incur a market penalty).

More broadly, our study may hold relevance for other domains of the duty of loyalty where some commentators have long advocated for greater contractual freedom. For example, several law and economics scholars have questioned whether certain insider trading prohibitions should become more “default-like” in nature, with issuers possessing the right to allocate insider-trading rights as a form of incentive compensation to managers, employees, and other corporate fiduciaries.132 While certain regulatory carve-outs already permit informed insiders to buy and sell securities (such as the safe harbor for executives trading in an automatic “10b5-1” plan133), such provisions are far narrower, more formulaic, and arguably more hazardous than a broader grant of authority to entities to allocate their insider trading rights, just as corporations now do with corporate opportunities. In fact, the availability of COWs may already enable

---

133 See 17 C.F.R. 240, 10b5-1.

134 See, e.g., Alan Jagolinzer, SEC Rule 10b5-1 and Insiders’ Strategic Trade, MANAGEMENT SCIENCE, February 2009 (documenting the gaming of the administrative rules governing 10b5-1 plans by insiders).
contractualizing insider trading rights in part: the opportunity to make strategic stock transactions in other companies' stock was long ago held to be a plausible corporate opportunity. A sufficiently generous waiver could permit a fiduciary to enter such transactions (even using confidential corporate information) without abrogating her fiduciary duties, the breach of which is a predicate element for 10b-5 liability under the “misappropriation” theory of insider trading. That said, COWs generally do not (and can not) insulate corporate insiders from liability under the “traditional” insider-trading theory when they purchase or sell their own company’s stock on the basis of material non-public information.

It is important to acknowledge that the availability of potential gains from making loyalty more contractible need not imply that it is socially optimal to give fiduciaries the unmitigated power to do so. Indeed, as noted above, the statutory reforms enabling COWs made nowhere near such sweeping pronouncements. Rather, they allow expanded contractual freedom to enter a waiver only under a specific condition: that the process by which the waiver is promulgated must itself be free from the taint of conflicts of interest. Like any other transaction, the action of the board and/or shareholders receives protection under the business judgment rule only to the extent that it is independent and free of influence from materially conflicted parties. This caveat suggests that even the COW reforms did not completely dispatch loyalty’s mandatory character from the corporate opportunities doctrine. A more abstract notion of immutable loyalty may still play a contributing role, albeit now from a substantially greater distance.

D. Shareholder Versus Social Welfare

Even to the extent COWs enhance shareholder value, there is no guarantee that they similarly serve broader social welfare goals. While healthy marketplace competition generally promotes both the welfare of shareholders and society, the two can diverge under a variety of familiar circumstances. One such circumstance is underscored by a newly resurgent literature examining the potentially anti-competitive effects of common ownership of natural competitors within the same industry. A series of recent papers document the dramatic rise in large ownership stakes by a small series of major institutional investors, such as BlackRock, Fidelity, State Street, and Vanguard, which have been widely assumed to be passive investors that exercise no influence over the firms in which they invest. For instance, BlackRock is now one of the ten largest

shareholders of 70% of the 2000 largest U.S. public firms with Vanguard approaching a similar scale of widespread and significant shareholding. As a result, a small number of institutional investors commonly have the largest ownership stakes in multiple (if not all) of the largest firms competing within a single industry.

Recent papers by Azar, Schmalz, and Tecu examine the potential anti-competitive effects of shared ownership among competitors on those firms’ performance. What they find is striking—common ownership correlates with higher ticket prices in the airline industry, higher prices for services in banking, and pay for executives that is based less on a firm’s own performance and more on its rivals’ performance, across a wide sample of U.S. publicly traded firms. A limited set of exogenous events affecting common ownership enable the authors to suggest a causal interpretation of these relationships. The bottom line of this and other recent research is suggestive and worrying: two fundamental desiderata of modern finance—diversified shareholding and effective corporate governance—may be deeply in tension with the maximization of social welfare.

This line of research may also bear ominously on how one interprets the positive reaction to COWs documented above. Shareholders may be embracing COWs, but at society’s expense, precisely because such provisions facilitate anti-competitive coordination among commonly owned, same-industry firms. Indeed, anecdotally, we can observe that many of the subjects of COWs in our sample are large private equity and venture capital firms likely to have ownership stakes in competitors within the same or related industries. While these firms are quite different from passive, highly diversified institutional investors, their horizontal ownership claims may plausibly be related to anti-competitive effects as well. Indeed, many possible channels exist for COWs to serve as effective mechanisms for dampening competition. Adopting a COW could act as an informational device by which competing firms signal to one another how they will carve up geographical areas or restrict quantities to reduce competition. Alternatively, COWs could simply occur among firms with overlapping directorates or dominant shareholders to directly reduce the extent to which fiduciaries are obliged to present new business prospects to firms to compete over. In either circumstance, the normative complexion of COWs could look quite different.

The approach undertaken here could be adapted to study whether COWs play a supporting role in suppressing competition. One plausible avenue for this inquiry would be to examine whether common ownership at either the firm or industry level predicts (or is predicted by) increased incidence of waiver adoption. Additional event studies, too, could interact market concentration measures with stock price reactions to COW adoption, including whether an adopting firm’s principal competitors experience positive

139 Anton et al., supra note 138, at 23.
140 Anton et al., supra note 138.
141 Pre-existing work in antitrust scholarship constructed a modification of the Herfindahl-Hirschman index ("HHI")—the HHI is frequently used by regulators to determine market concentration—called the MHHI, which includes measures of common ownership across competitors within the same industry. See Timothy F. Bresnahan & Steven C. Salop, Quantifying the Competitive Effects of Production Joint Ventures, 4 Int’l J. Indus. Org. 155 (1986); Daniel P. O’Brien & Steven C. Salop, Competitive Effects of Partial Ownership: Financial Interest and Corporate Control, 67 Antitrust L.J. 559 (2000); see also Anton et al., supra note ___ (adopting and deploying MHHI in study of effects of common ownership on executive compensation structures). The MHHIΔ (MHHI – HHI) captures the contribution of common ownership in particular as separated from market concentration.
abnormal returns around the date of adoption. Locating an appropriate exogenous event that increased common ownership could assist in pursuing causal identification. We leave such endeavors to pursue another day.

**CONCLUSION**

At the turn of this century, Delaware ignited an unprecedented, multi-state experiment in empowering corporations to waive the corporate opportunities doctrine—an integral part of the fiduciary duty of loyalty. Some sixteen years later, this study has presented what we believe is the first systematic analysis of how corporations responded to this wave of statutory reforms, as well as related market reactions. Our empirical analysis suggests that public companies have shown a significant appetite for enacting waivers, and that their newfound contractual freedom has been received positively (by and large) among investors. This inquiry is interesting in its own right, but it also shares a nexus with some of corporate law’s most important and vexing questions. Descriptively, do corporations actively opt out of corporate law’s default rules when freed to do so? And when they do displace default rules, do such efforts add value or act as a new conduit for managerial opportunism and agency costs? Only when we have a good sense of the answers to both of these questions can we make progress on a third, which is among corporate law’s most indispensable: Are market forces sufficient to ensure optimal corporate governance for corporations? Our analysis provides evidence that there may be substantial scope for loosening at least some of the ossified strictures of the duty of loyalty, permitting corporations greater freedom to tailor their governance arrangements so as to best suit their needs and capabilities.

More generally, our analysis also reveals an important lesson for the complementary roles that theory, practice, and empiricism can play in legal scholarship. Agency cost theories can provide helpful frames for thinking about the normative stakes involved in analyzing fiduciary waivers, but theory alone is often indeterminate. Practical experiences can help generate insightful anecdotes and stories about purported “best practices,” but they too can easily lead to errant conclusions. Lastly, empirical investigation can provide precise evidence about observable phenomena, but if such evidence is left untethered to underlying theory and intuition, it remains unclear why such evidence is either relevant or interesting. This study has attempted to make contributions along all three dimensions, gleaning in the process a rich collection of insights that can usefully inform policy debates. Our analysis lends support to the course that Delaware fiduciary law has begun to chart into the 21st Century. It is a course in which stakes remain endemically high, and where foundational debates constantly recur. And perhaps consequently, it is a site where empirical inquiry seems long overdue.
