Economic Democracy and Enterprise Form in Finance

William H. Simon

In terms of institutional design, “democratizing finance” could play out in one or both of two trajectories. First, there is what Fred Block in his introductory essay calls the “public utility model”. This approach would tighten regulation of enterprises that would continue to be organized as for-profit or investor-owned corporations. The second would transfer responsibility and resources to organizations constructed to internalize public goals and values – government agencies or corporations, cooperatives, and charitable nonprofits.

The first course is less radical. The “public utility” model is basically the one that is now in place. Block would tighten regulation, but only one of his proposals seems a major departure from current practice – limitations on profits. The alternative institutions emphasized in the second approach currently exist in various manifestations, but moving them to the center of the financial system would involve an epochal change.

To the extent that reform is guided by democratic ideals, the two approaches involve different instantiations of democracy. In the regulatory approach, actors accountable to general electoral processes impose external constraints on organizations that retain discretion to pursue private goals within the constraints. In the second approach, political responsibility is imputed to actors within the organization, and they are expected to use their discretion to further public values as well as the private interests of the organization’s constituents.

I propose to consider the rationales for the second approach and the forms that democratized ground-level financial institutions might take. There are two relevant types of democracy – general electoral democracy and stakeholder democracy. And with each of these types, it is worth distinguishing between relatively direct and relatively indirect forms of democratic control. I suggest reasons for thinking that the most directly democratic forms are not necessarily the most promising.
The key rationale for the move to more democratic forms is to better align managerial incentives with public interests. Such alignment requires not only redirection but also broadening of incentives. Thus, effective enterprise reform requires the creation of techniques of monitoring and performance assessment that accommodate multiple, complex, and competing goals. Such techniques do not exist in any fully developed form. They are in the process of creation. These techniques have further implications for institutional configuration. They suggest that informal lateral connections among peer institutions may as important as the internal structure of the institutions.

I. The Problem With the Business Corporation

The call for democratization at the enterprise level arises from dissatisfaction with the business corporation. The critical defining features of the business corporation are (a) the attachment of control rights to capital rights, and (b) free transferability and accumulability of ownership interests. In the 1980s, these features produced two critical phenomena: (a) the market for corporate control, and (b) legal recognition of shareholder value maximization as the meaning of managerial fiduciary duty.

The for-profit corporate firm lodges control in the firm’s investors, that is, those who have the residual claims on its income and assets. This creates uniquely powerful incentives for maximizing profits. It gives strategic discussion within the organization what Claus Offe and Helmut Wisenthal call a “monological” character. From the investor’s perspective, this characteristic is advantageous; it reduces “decision costs”. Offe and Wisenthal, writing from the left, and Henry Hansmann, writing from the center, all attributed the dominance of the business corporation over competing forms to its superior ability to devise and commit to a coherent strategy. It is easier to agree on a strategy to maximize profits than on one to optimize multiple conflicting goals of various constituencies.

However, from a social perspective, there is a disadvantage. To the extent that the corporation’s activities generate negative externalities, the powerful internal incentives push against taking account of them. Public concerns can be addressed through regulation to the extent that officials can formulate and enforce
regulations effectively. But the powerful incentives of the for-profit form can induce activity designed to defeat effective formulation and enforcement.

The conception of the corporation as single-mindedly devoted to profit maximization has been around for a century and a half, but it has only recently been embraced by the law, and business elites were quite divided about it for much of the 20th century. In the mid-20th century, most lawyers and many economists advanced a different view. According to this view, the “separation of ownership and control” arising from the dispersion of shares meant that shareholders had limited practical opportunities to discipline management. (The main practical opportunities were the proxy contest and the derivative suit, both of which were expensive and rare.) Managers thus had a good deal of discretion. They could use this discretion to profit themselves. But they could also use it to benefit non-shareholder constituencies. These included organized labor, local communities, and customers. Some interpretations of the large mid-century corporation portrayed the manager’s role as mediating among shareholders and these other constituencies to hold the enterprise together in some productive collaboration. This portrayal was, to varying degrees, both normative and descriptive.3 The courts generally upheld management discretion to act in the interest of non-shareholder constituencies.

Since the 1980s, however, the courts and the corporate elite have embraced the monological conception. On the legal scene, the key development has been the hostile takeover. Prior to its advent, the monological conception would have been difficult to enforce. Courts did not feel they could second-guess management when they asserted that some benefit to non-shareholders would serve long-run profitability. But the takeover allows enforcement by the market for corporate control. Entrepreneurs who believe management is failing to maximize profits can earn their own profits by acquiring control and replacing the incumbents. The courts, as they cleared the way for the takeover, began to speak about “shareholder value” as the governing norm with unprecedented clarity. 4

The social disadvantage of the organization’s single-minded focus on profit is especially acute to the extent that there is asymmetry of information between public
regulators and the organizations. If the risks regulation addresses are caused by technology that is exceptionally complex, evolves rapidly, or varies locally, regulated actors are likely to have better understanding than officials. Their incentives are to use this superior understanding to further profits for the enterprise at the expense of exacerbating risks that are substantially borne by others.

In banking the most pertinent challenges arise from government subsidization of risky activities through such mechanisms as deposit insurance, last-resort-lending, and implicit too-big-too-fail bailout insurance. The banks push against regulatory constraints to take on more risk because government subsidizes it. They finance speculative investment at the expense of investment in the real economy despite the fact that social returns to latter are higher. And they are indifferent to positive externalities that come from investment in underdeveloped regions or disadvantaged people or the environment.

A further concern is the potential for exploitation of unsophisticated customers that arises from the relative complexity of even routine financial transactions. The increased exposure of banks to competition since the 1980s has improved customer service in some ways, but customers are egregiously exploited in others. The recent Wells Fargo scandal that led to the firing of 5,000 employees is one of the most extensive consumer frauds in history.

Banking is not the only area where the social desirability of the for-profit form is being questioned. In the late 20th century, in several areas where public or charitable provision was customary, experiments were undertaken with for-profit enterprise. Efforts were most notable in health care and education. More radical initiatives founded on the same logic occurred with prisons and military services. In all these areas, aggregate performance of for-profit enterprise has disappointed proponents, and there have been many scandals.

II. Varieties of Enterprise Democracy

In the enterprise context, democracy can be understood as greater accountability to the general electorate on the one hand or to stakeholders on the other. And within the general and stakeholder fields, we can distinguish relatively direct and relatively indirect forms of accountability. These two parameters yield
four types of enterprises: state corporations, state agencies charitable nonprofits, and cooperatives.

DEMOCRACY AND ENTERPRISE FORM

Type of Democracy

<tr>
<td>Direct</td>
<td>State Agency</td>
<td>Cooperative</td>
</tr>
</tbody>
</table>

In the next two sections, I assess the relative advantages of the different types, considering first the relatively directly democratic forms, then the relatively indirect ones. In general, I suggest that the relatively indirect ones are more promising in most relevant contexts.

III. Relatively Directly Democratic Enterprise Forms

Legally, the incidents of relatively direct democratic enterprise control are, first, the power of elected officials or stakeholders to remove enterprise directors at will, and second, strong control by elected officials or stakeholders over the organization’s resources. In other words, the enterprise is dependent on elected officials or stakeholders for frequent budget appropriation or approvals. The key relatively directly democratic forms are the state agency and the cooperative.

The State Agency. The state agency is an organization governed by directors appointed by elected officials. If we take the form in which democracy – here, electoral control -- is strongest, the directors would serve at the pleasure of elected officials.
officials, and the entity would be entirely reliant on annual appropriations from a
general government. Its resources would be redeployable at the will of the general
government. It would have neither taxing nor borrowing authority of its own. Its
contracts would be subject to approval by the general government.

This description fits many public entities exercising regulatory authority,
such as the Environmental Protection Agency or a local zoning board, and providing
services, such as the Veterans’ Administration or most public schools or police
departments. However, it has often been doubted that such entities are well-suited
for major financial or economic development roles. The reasons relate to problems
with this kind of democratic control. First, with strong electoral control, it is
difficult to execute long term plans or projects that extend over many election
cycles. Voters can be short-sighted, and their attention can wander. Only a few
issues can be salient in a general election; so electoral decision may be inconsistent
over time as attention flits. And of course, politicians may use their control
opportunistically to get short-term electoral benefits. Think of Richard Nixon
pumping up the money supply in 1972 or Chris Christie cancelling the Hudson River
tunnel to protect tax cuts in 2012.

An individual or a private organization can undertake long-term projects by
making long-term contractual commitments. But government long-term
commitments compromise strong electoral democracy. Or at least, this is one
influential view. It explains the current constitutional rules in most states that
require balanced budgets or the common 19th century rule that precluded many
municipalities from committing to contracts that extended beyond the terms of the
officials approving them. On a larger scale, it explains the resistance to independent
monetary authorities or central bank independence. Independent monetary
authorities compromise democratic control. And they are accused of bias toward
dogmatic or class-biased tight money policies. But popular pressures for alternative
policies can cause harmful inflation or interest rate rises.5

The general effects of direct popular control seem unclear, but there are
ample grounds for caution. For example, Nathan Jensen and Edmund Malesky
recently reported a study of local government incentives for business investment.
They echo the widely held view among economists that such subsidies tend to be ineffective or unnecessarily generous and have regressive fiscal impacts. They proceeded to study the relative effects of direct and indirect electoral control on the propensity to offer such subsidies. They compared cities managed directly by elected officials—mayors and city councils—with cities in which elected officials manage indirectly through an appointed city manager. The city-manager regimes were inaugurated in the Progressive Era out of concern that direct management by elected officials was susceptible to voter short-sightedness and official corruption. The study vindicates at least the short-sightedness part of the hypothesis. Mayoral regimes are substantially more disposed to offer pointlessly generous subsidies to attract businesses than city-manager ones. The authors suggest that voters penalize officials when enterprises leave or fail to come in, but not when subsidies conferred on them turn out to be ineffective or unnecessary.

The Cooperative. The second version of directly democratic enterprise is the stakeholder-controlled corporation. The cooperative is the paradigm here. The cooperative is a private entity controlled by its “patrons.” Patrons have some active connection to the enterprise in addition to investment. Typically, they are customers, workers, or suppliers. The patrons are the residual claimants on the firm’s income and (though there is some ambiguity here) assets. In uniting control and residual economic claims, the cooperative resembles the business corporation. But there are key differences. The patron’s economic claims cannot be transferred independently of their control claims, and since their control claims are premised on some active participatory role, new owners must be approved by the remaining owners. So shares are not freely transferable. There is thus no possibility of a hostile takeover.

In addition, control rights in the cooperative are generally distributed equally without regard to investment. Each member gets one vote. Financial reward is distributed on the basis of a combination of investment and economic participation (“patronage”).

The cooperative is the enterprise form that most embodies democratic ideals. But it has disadvantages, and experience with it has been mixed. Two
problems arise from the incompleteness of representation. Typically, only one set of stakeholders is represented, although others are affected. For example, agricultural marketing cooperatives, which are controlled by suppliers (farmers), have engaged in anti-competitive practices that harm consumers. And then, the democratic promise is only fulfilled when stakeholders who are represented devote effort to governance. Passive or indifferent patrons are vulnerable to exploitation, as illustrated by some cooperative (mutual) insurance companies that have been re-organized to allow management to appropriate patron capital.

Moreover, cooperatives have difficulty expanding because they cannot provide controlling interests (equity) to outsiders. They can expand only through debt or capital contributions and retained earnings of patrons. In many organizations, patrons will have limited ability to finance themselves.

Still another problem arises from the distributive disjunction between control and reward. Control is distributed equally, but there can be wide variation among economic shares. So the problem arises that members with poor economic endowments may use their control in ways that redistribute away from those with relatively rich claims. If there is inequality, the poor may have different preferences about retaining and distributing earnings and about consumption within the enterprise. This can produce the kind of internal conflict that threatens the enterprise. A relevant phenomenon recently seen in law firm general partnerships – which used to and still can resemble cooperatives – are disputes over retirement programs. Sometimes the high-billing partners object to firm-wide pension programs, which tend to be relatively egalitarian. When they are outvoted, they may leave, sometimes causing the partnership to collapse. Alternatively, if the members with relatively large accounts have voting control, they may use it to alter the enterprise form to enable them to cash out the full value of their equity. The prohibition on outside equity narrows the class of buyers for the shares of retiring members to newcomers willing and acceptable as patrons. This lowers their value. Older members of successful cooperatives may have strong incentives to push to convert the enterprise out of the cooperative form so that the firm can be sold to outside investors. The remaining owners then become employees.
Perhaps the most distinctive disadvantage of the cooperative form from a democratic perspective is a bias toward exclusion. The bias has two sources. First, because the cooperative relation is a relatively thick one involving multiple dimensions, cooperators may be choosy about new entrants in a way that corporate shareholders (assuming we're talking about public corporations) would not be. Second, cooperators may worry about internal redistribution. If new entrants generate less income, they will still have equal control rights. So new entrants who seem likely to perform below the average of incumbents will be disfavored.

An extreme example of the bias is the New York City housing market where for a long time building-wide resident cooperatives were favored over individual condominium ownership. The cooperative form meant that residents were mutually responsible for the building mortgage, which made them reluctant to admit newcomers with less than average financial resources. That problem, however, could have been mitigated by adopting the condominium form, where collective responsibility only applies to the common areas. Nevertheless, the cooperative form was favored because it not only encourages but legitimizes certain forms of discrimination that might otherwise be difficult to achieve. Condominium owners have no standard mechanism to veto people to whom their neighbors wish to sell. And the law makes it difficult to achieve such vetoes contractually by severely limiting enforcement of “restraints on alienation”. The cooperative form, on the other hand, requires a collective judgment before a sale can occur. Residents can use their veto to exclude people they dislike for virtually any reason. In theory, they are still bound by anti-discrimination law with respect to race and other protected characteristics, but it is very difficult to prove that a decision was based on such considerations.

In the financial sector, cooperative banks, or “credit unions” as many are called, typically limit lending to depositors and often require, in addition, that depositors and borrowers have some further relation, such as employment by a common employer. This arrangement makes for trust and information-sharing and is associated with lower borrower default rates. But it limits the range of potential participants.
IV. Relatively Indirectly Democratic Enterprise Forms

The drafters of the US Constitution rejected “democracy”, their term for relatively direct forms of popular rule, for republicanism, their term for relatively indirect forms.\textsuperscript{11} So the President is not elected directly; voters choose electors who in turn choose the President. And until the 17th Amendment, Senators were chosen by state legislators.

A major source of the drafters’ suspicion of popular control was fear that the voters would be short-sighted or reckless in financial matters. Their solution – indirect control – was designed to “refine and enlarge” the views of public officials by attenuating their accountability to the electorate.

The specific processes of indirect control in the Constitution are not highly regarded today. The indirect election of Senators has been eliminated, and hardly anyone defends the electoral college. But if we look at the institutions that have developed to combine public accountability with financial or economic development, something like the idea of indirect control is prominent. The key examples are the government corporation and the charitable nonprofit corporation.

The Government Corporation. I use the term government corporation to describe a range of entities that are sometimes called corporations – for example, the Reconstruction Finance Corporation – but also go by other names, especially “authority”, as in the Tennessee Valley Authority or state and local redevelopment and transportation authorities.

The government corporation is an entity treated as a separate accounting unit with authority to take various actions (e.g., contracting, holding property, borrowing) in its own name and on its own initiative. However, ultimate control and financial rights are retained wholly or mostly by the general government. The governing board of the corporation is mostly appointed by elected officials. They may include stakeholder representatives, but they have fiduciary duties to the entity as a whole and are not representatives of the stakeholders in the electoral sense.

Typically, electoral control is attenuated by two sorts of mechanism. First, there are control procedures. The tenures of board members may be staggered across electoral cycles, and removal may be precluded except for demonstrable
cause. Thus, elected officials can change control of the corporation only gradually and sometimes only over more than a single electoral cycle. At the sub-national level, insulation can be achieved by sharing control of a corporation across separate municipalities, counties, or states. If control is divided among members chosen by different jurisdictions, no single electorate can induce a change of control unilaterally.

The other kind of insulating mechanism concerns finance. The corporation can be given borrowing authority and control over income or assets. Using the assets or income as collateral for borrowing removes them from control of elected officials. And if the corporation controls income flows that exceed its operating and debt service costs, it may have substantial discretion to undertake projects free of electoral oversight.

Transportation and development authorities at the sub-national level illustrate the advantages and disadvantages of such arrangements. The authorities are able to execute long-range plans that require commitments across many electoral cycles and coordination across multiple jurisdictions. Without their relative autonomy from the electoral process, short-sightedness or inconsistency and parochialism might preclude valuable initiatives. On the other hand, political insulation is also associated with arrogance and contempt for non-elite interests.

The advantages of the state corporation are displayed in the story of the massive clean-up of Boston Harbor in the 1980s and 1990s. For decades the harbor was scandalously polluted. Efforts to remedy the situation failed despite the illegality of much of the contributing conduct and broad political support for remediation. A major obstacle appears to have been the extreme fragmentation of authority. Effective intervention occurred only under the prodding of an ambitious lawsuit, and its centerpiece was the creation of the Massachusetts Water Resources Authority – “a new independently financed state authority to take over the roles of planning, constructing and administering” the clean-up. Having proved intractable to electoral institutions for decades, the problem was solved with the interventions of two non-electoral ones – the court and the independent authority.
Of course, the dark side of the independent authority is even better known, especially through Robert Caro’s account of how Robert Moses turned the Triboro Bridge and Tunnel Authority into an empire more powerful than the elected government of New York. Moses created a modern automobile-based transportation infrastructure but at a cost that included neglect of public transportation, the destruction of many vital neighborhoods, and the herding of poor people into dysfunctional and under-maintained high-rises.13

The Charitable Nonprofit. The other relatively indirectly democratic enterprise form is the charitable nonprofit corporation.14 The charitable nonprofit is an extremely flexible instrument. Anyone can form one, and the law permits many control arrangements. Governing board members can be appointed by public officials or private individuals, elected by members (if there are members but there need not be), or filled by remaining incumbents as others depart. Officers and board members must act disinterestedly. They may not use control to benefit themselves at the expense of other stakeholders.

Government subsidizes the organization through tax exemptions for the organization and tax benefits for donors. It polices the organization to make sure that (a) its activities are confined to areas that could broadly be characterized as charitable (i.e., perform some social good not adequately served by for-profit enterprise); (b) it is not being used for private inurement; (c) it is devoting donated resources consistently with its undertaking to donors. But within these broad constraints, directors and officers have discretion to pursue the organization’s public-regarding goals comparable to the discretion of for-profit managers to pursue profit-maximizing.

Viewed individually, charitable nonprofits are not necessarily democratic, though they can be. Nonprofits need not have members at all, and their boards can be self-perpetuating oligarchies. However, excessively narrow control groups may raise doubts about whether activities are truly charitable or involve private inurement and are thus discouraged by the prospect of regulatory scrutiny. Moreover, nonprofits can be strongly democratic, and both private and public contributions to them can be conditioned on democratic governance. For example,
nonprofits wishing to be characterized as “community development corporations”, in order qualify for certain grants, must admit all interested members of their catchment area to membership and allow them to elect a portion of the board.

Viewed collectively, the nonprofit sphere has democratically attractive features. Since it accommodates initiative so easily, it makes possible diversity and experimentation.

Governance aside, accountability can arise to the extent that the enterprise depends on public financial support. The law is ambivalent about the degree of economic autonomy nonprofits should have. An enterprise that starts out with or accumulates a large endowment can operate on its passive income without any need to raise more. Many view this as problematical. Just as control over public resources can insulate the state corporation from political accountability, control over its own capital can insulate nonprofits from the accountability that arises from the need to convince current donors, contractors, or patrons of the value of its services. Thus, there are doctrines designed to limit this kind of insulation, though they tend to be half-hearted. One rule measures the degree of a nonprofit’s income that comes from “public support” (current donations, fees for charitable services, government contracts) as opposed to passive income and imposes some disadvantages on those who fail to meet a minimum. Another requires “private foundations” (enterprises that make grants from endowment income) to spend at least five percent of their endowment each year.

V. The Influence of Dialogic Assessment on Enterprise Form

The four alternative forms either demand or permit control structures more conducive to democratic accountability than those of the business corporation. They also prescribe or encourage enterprise norms that are diverse and public-regarding. They require “dialogic” assessment that considers and reconciles multiple values. (The cooperative is a partial exception to the claim about public-regarding ends. In principle, cooperatives maximize the welfare of their members. However, since their members occupy multi-stranded relations with each other – as both capital suppliers and patrons/participants, their interests are diverse and may diverge less from public ones.)
In addition, all four of the alternative forms depart from the incentive structure of the business corporation. They eliminate or, in the case of cooperatives, limit the opportunities of managers to profit from capital gains and limit their ability to benefit from increases in the enterprise’s income. This blunts high-powered incentives to evade regulatory restrictions or create negative public externalities. There are of course disadvantages. There are no material incentives for innovation or cost minimization comparable to those in private enterprise. And of course, “decisions costs” may be higher because conversations about goals or performance are longer and more complex.

The main material incentive for these enterprises is the continuing need to attract new resources without the ability to offer capital shares. The enterprises must convince people to pay for their services (either on a first-party or third-party basis) and/or to make donations, and this will usually mean convincing them of the value of their efforts. As a purely economic matter, these incentives are not high-powered. Donors have limited ability to monitor performance, and large endowments or underserved reputations sometimes allow organization to escape pressures for accountability.

Granting that the alternative forms avoid the limitations of monological assessment, the question remains how the more complex assessment they make possible is to be organized. To begin with, how do we limit the assessment criteria so that they provide some discipline? If the criteria are too vague and too numerous, it will be hard to generate meaningful conclusions about performance. Moreover, once the criteria are limited and specified, they will have to be revised to take account of unforeseen consequences – counterproductive adaptation (e.g., “teaching to the test”), collateral consequences, or technological innovations. Once we allow for the need for continuing reconsideration of the criteria, every unflattering measurement can be interpreted as either an indication of poor performance or a symptom that the metric needs revision.

Another problem has to do with learning. The for-profit form creates strong individual incentives for firms to learn, but it also encourages them to hide a lot of the knowledge they acquire from their competitors and to distort the information
they provide shareholders and regulators. The market deals with slow learners by eliminating them, not by helping them learn. The alternative enterprise forms are more conducive to information sharing. The problem is that there is some trade-off in the design of an assessment regime between facilitation of learning and motivation of effective effort. The criteria that have the most diagnostic value may not be the ones that most readily facilitate rankings or threshold determinations that can justify sanctions, such as withdrawal of resources.

There is no definitive solution to these problems, but responses to them have tended to converge in a distinctive architecture. Assessment takes the form of a kind of deliberative engagement across firms or organizations. The organizational structure is neither a market nor a bureaucracy but a set of shifting and informal networks.

The most distinctive mechanism is peer review. Organizations are assessed by teams of outsiders from organizations performing tasks similar to theirs. The practice is most fully developed in medicine, especially with respect to hospitals, but it is pervasive. Peer review strives to combine learning with comparative assessment. Metrics tend to emphasize diagnosis, and they are explicitly provisional. A central focus of inquiry is the organization’s capacity to adapt to new circumstances, learn from its mistakes, and integrate new knowledge generated elsewhere. Yet, such reviews often generate rankings and comparisons. Rankings and comparisons have diagnostic value because they indicate where the best practices are to be discovered. But they also can serve accountability purposes.

The term peer review connotes a horizontal dimension, but the process has hierarchical elements. The process must be organized across firms by a coordinating organization. This organization might be controlled collectively by the firms under review themselves, but more commonly it is a nonprofit corporation with substantial representation of those under review but with significant, often controlling, representation by other stakeholders.

A further hierarchical dimension arises from the use the peer review process as an indicator or requirement by regulators, funders, and customers. For example, in the medical area, participation in the Joint Commission on the Accreditation of
Hospitals (JCAH) process and minimally satisfactory ratings are conditions of various professional licenses and reimbursement by Medicare and private insurers.

The peer review process presupposes a willingness to share knowledge across firms. The process is thus limited in the for-profit sector. True, there is quite a bit of knowledge sharing in the for-profit sector. Many of the hospitals in the JCAH network are for-profit. Nevertheless, for-profit firms will not freely share information on matters on which they are competing intensely. Conversely, it is an advantage for nonprofit organization that it lessens this inhibition.

The most developed performance metrics in the financial sector are the traditional accounting norms of profitability and “safety and soundness.” Efforts have begun only relatively recently to develop metrics that take account of other social goals. For example, there is the Global Impact Investing Rating System overseen by the Global Impact Investment System. These approaches, however, have a long way to go to achieve the sophistication of the hospital regime or to provide the requisites of accountability for a broadened nonprofit financial sector.

Peer review regimes generate accountability in two distinctive ways. First, peer review constitutes accountability at the firm level. Practitioners account to peers. This is a somewhat different accountability from that overseen directly by either public officials or stakeholders. Peer reviewers typically do not hold public office and are not electorally accountable. Although they may have stakes in the industry, they do not have stakes in the firm under review, and they are supposed to be disinterested, not representative in the political sense. Part of the rationale for these regimes is that the duty to explain your practices and submit to the judgment of peers contributes to responsibility both by forcing articulation and reflection and through mechanisms of pride and shame.

At a second level, the regimes induce accountability by making the organization’s operations more transparent to outsiders, including both stakeholders and electorally accountable officials. The outsiders can use this information to make much more plausible judgments than they otherwise could about what support to give the organizations.
For immediate purposes, the key point is that attempt to democratize the financial sector depends at least as much on the development of these mechanisms of transparency and responsibility as on the choice among alternative enterprise forms.

V. Conclusion

The business corporation became more narrowly profit-focused at just the moment when changes in the financial sector generated opportunities to earn large returns by shifting risks to the public sector. Tightened regulation is one response to this situation. But especially in a technologically dynamic industry, regulators have trouble adapting to new contingencies and detecting innovative forms of evasion. So there is some appeal to an alternative approach to aligning private and social incentives – a change in enterprise structure. This move is sometimes characterized in terms of economic democracy and could involve democracy in two ways – by enhancing electoral control over the enterprise or by providing more control to people with interests other than profit. All the relevant enterprise forms have disadvantages, however, and it is arguable the ones affording the most direct democratic control tend to be the least effective. In any event, whichever of the nonprofit forms is chosen, accountability will depend on effective modes of assessment and information sharing across enterprises.

5 E.g., Guy Debelle, Central Bank Independence in Retrospect (Reserve Bank of Australia 2017).
7 A few states have adopted an innovation that allows "limited" outside equity interests in business corporations. James R. Baarda, "'Outside' Cooperative Equity: Obligations, Tradeoffs, and Fundamental Cooperative Character" (2004).
8 A variation on the patron-controlled enterprise form that can be found in some water districts and homeowners' associations distributes control (as well as the economic incidents of participation) in accordance with the value of a member's land or housing unit served by the organization. See Robert Ellickson, Cities and Homeowner's Associations, University of Pennsylvania Law Review 130 (1983): 1519-80. Such arrangements minimize the danger of opportunistic
redistribution but at the cost of seriously compromising the democratic character of the enterprise. Some argue that the sacrifice of democracy inhibits the solidarity necessary for effective collaboration.

Technically, there are two types of nonprofit – “public benefit” or charitable nonprofits and “mutual benefit” nonprofits. Mutual benefit nonprofits are more or less equivalent to cooperatives.

For example, the governing board of the Joint Commission on the Accreditation of Hospitals has, in addition to representatives of the American Hospital Association, representatives of the various medical practitioner associations, public members chosen by public officials, and independent members chosen for expertise in particular fields.
